
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

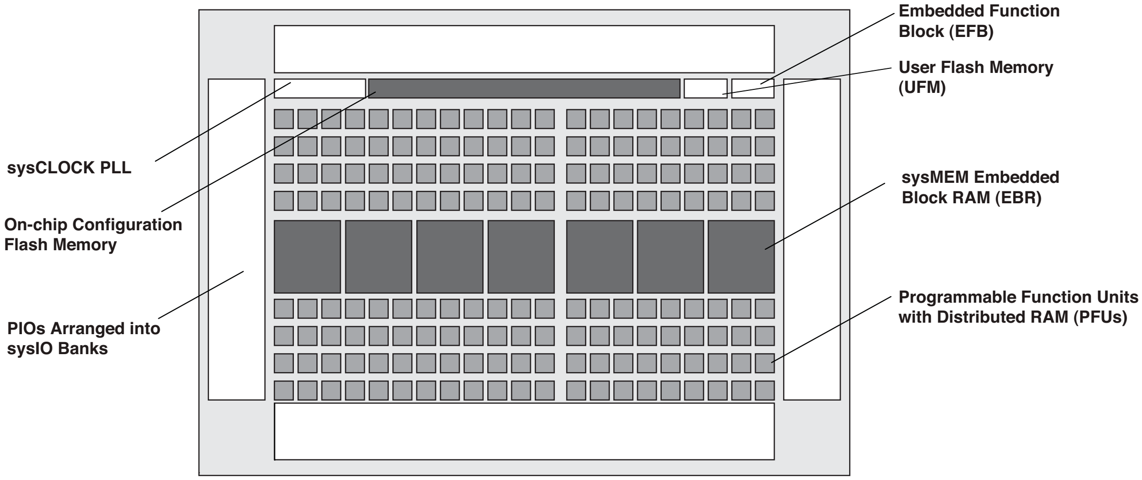
Details	
Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	206
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LFBGA
Supplier Device Package	256-CABGA (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-4000hc-4bg256c

March 2016 **Data Sheet DS1035**

Architecture Overview

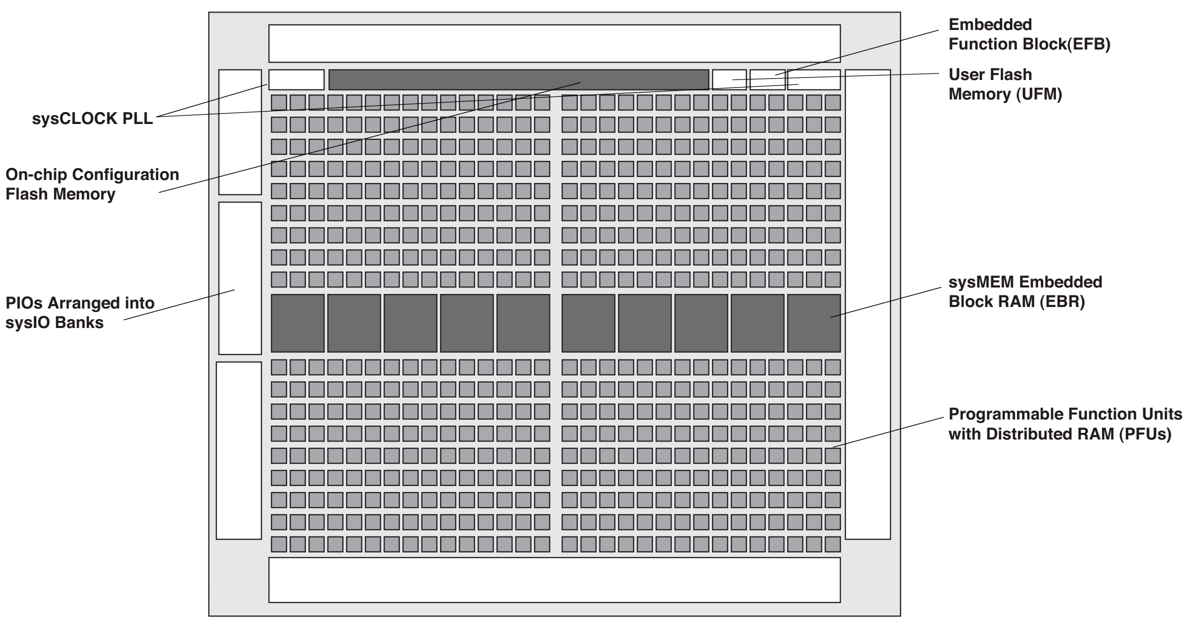
The MachXO2 family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). The larger logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO2-1200 Device



Note: MachXO2-256, and MachXO2-640/U are similar to MachXO2-1200. MachXO2-256 has a lower LUT count and no PLL or EBR blocks. MachXO2-640 has no PLL, a lower LUT count and two EBR blocks. MachXO2-640U has a lower LUT count, one PLL and seven EBR blocks.

Figure 2-2. Top View of the MachXO2-4000 Device



Note: MachXO2-1200U, MachXO2-2000/U and MachXO2-7000 are similar to MachXO2-4000. MachXO2-1200U and MachXO2-2000 have a lower LUT count, one PLL, and eight EBR blocks. MachXO2-2000U has a lower LUT count, two PLLs, and 10 EBR blocks. MachXO2-7000 has a higher LUT count, two PLLs, and 26 EBR blocks.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
  — A greater-than-or-equal-to B
  — A not-equal-to B
  — A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO2 devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO2 devices, please see TN1201, Memory Usage Guide for MachXO2 Devices.

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Table 2-4. PLL Signal Descriptions (Continued)

Port Name	I/O	Description
CLKOP	O	Primary PLL output clock (with phase shift adjustment)
CLKOS	O	Secondary PLL output clock (with phase shift adjust)
CLKOS2	O	Secondary PLL output clock2 (with phase shift adjust)
CLKOS3	O	Secondary PLL output clock3 (with phase shift adjust)
LOCK	O	PLL LOCK, asynchronous signal. Active high indicates PLL is locked to input and feed-back signals.
DPHSRC	O	Dynamic Phase source – ports or WISHBONE is active
STDBY	I	Standby signal to power down the PLL
RST	I	PLL reset without resetting the M-divider. Active high reset.
RESETM	I	PLL reset - includes resetting the M-divider. Active high reset.
RESETC	I	Reset for CLKOS2 output divider only. Active high reset.
RESETD	I	Reset for CLKOS3 output divider only. Active high reset.
ENCLKOP	I	Enable PLL output CLKOP
ENCLKOS	I	Enable PLL output CLKOS when port is active
ENCLKOS2	I	Enable PLL output CLKOS2 when port is active
ENCLKOS3	I	Enable PLL output CLKOS3 when port is active
PLLCLK	I	PLL data bus clock input signal
PLLRST	I	PLL data bus reset. This resets only the data bus not any register values.
PLLSTB	I	PLL data bus strobe signal
PLLWE	I	PLL data bus write enable signal
PLLADDR [4:0]	I	PLL data bus address
PLLDATI [7:0]	I	PLL data bus data input
PLLDATO [7:0]	O	PLL data bus data output
PLLACK	O	PLL data bus acknowledge signal

sysMEM Embedded Block RAM Memory

The MachXO2-640/U and larger devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-kbit RAM, with dedicated input and output registers. This memory can be used for a wide variety of purposes including data buffering, PROM for the soft processor and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-5.

Figure 2-8. sysMEM Memory Primitives

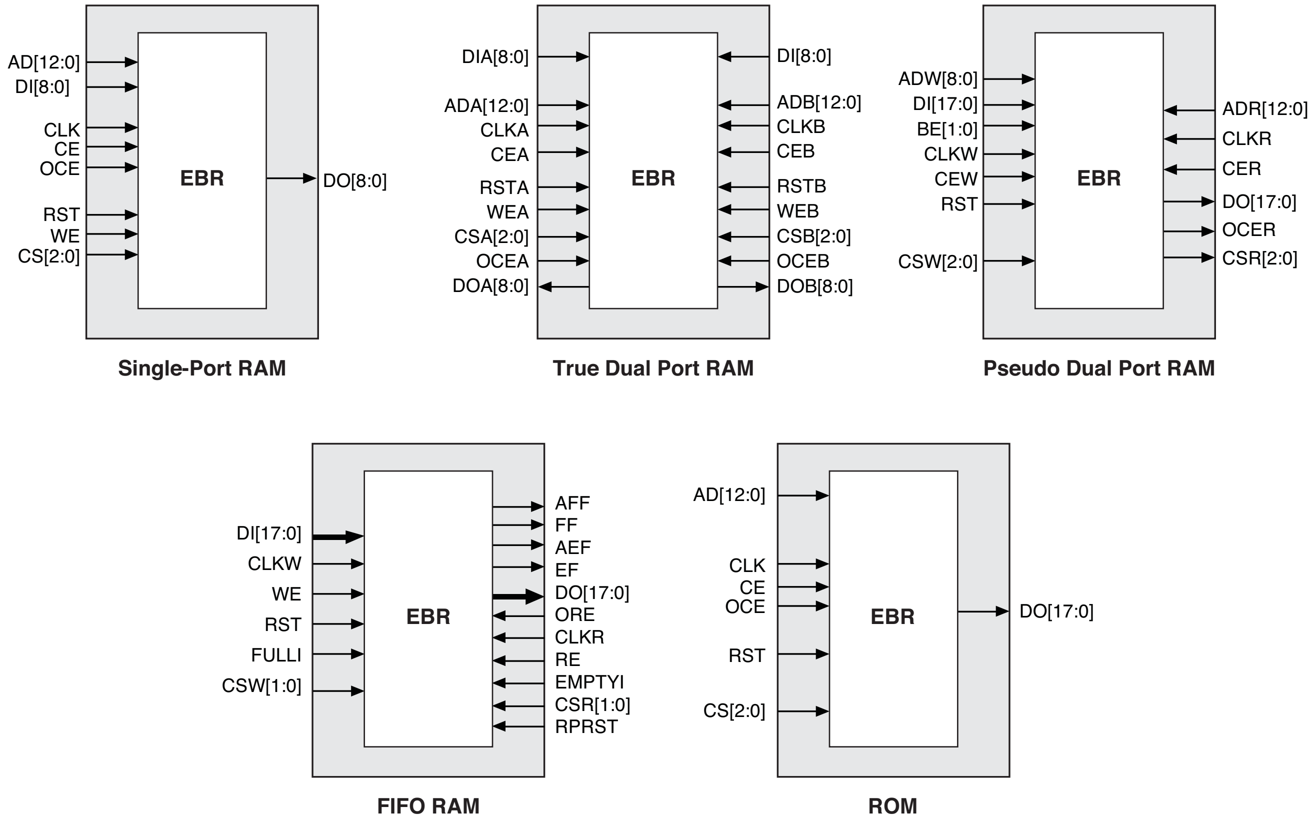


Table 2-6. EBR Signal Descriptions

Port Name	Description	Active State
CLK	Clock	Rising Clock Edge
CE	Clock Enable	Active High
OCE[1]	Output Clock Enable	Active High
RST	Reset	Active High
BE[1]	Byte Enable	Active High
WE	Write Enable	Active High
AD	Address Bus	—
DI	Data In	—
DO	Data Out	—
CS	Chip Select	Active High
AFF	FIFO RAM Almost Full Flag	—
FF	FIFO RAM Full Flag	—
AEF	FIFO RAM Almost Empty Flag	—
EF	FIFO RAM Empty Flag	—
RPRST	FIFO RAM Read Pointer Reset	—

1. Optional signals.
2. For dual port EBR primitives a trailing ‘A’ or ‘B’ in the signal name specifies the EBR port A or port B respectively.
3. For FIFO RAM mode primitive, a trailing ‘R’ or ‘W’ in the signal name specifies the FIFO read port or write port respectively.
4. For FIFO RAM mode primitive FULLI has the same function as CSW(2) and EMPTYI has the same function as CSR(2).
5. In FIFO mode, CLKW is the write port clock, CSW is the write port chip select, CLKR is the read port clock, CSR is the read port chip select, ORE is the output read enable.

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – Data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – A copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – When new data is being written, the old contents of the address appears at the output.

FIFO Configuration

The FIFO has a write port with data-in, CEW, WE and CLKW signals. There is a separate read port with data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. Table 2-7 shows the range of programming values for these flags.

Table 2-7. Programmable FIFO Flag Ranges

Flag Name	Programming Range
Full (FF)	1 to max (up to 2^N-1)
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

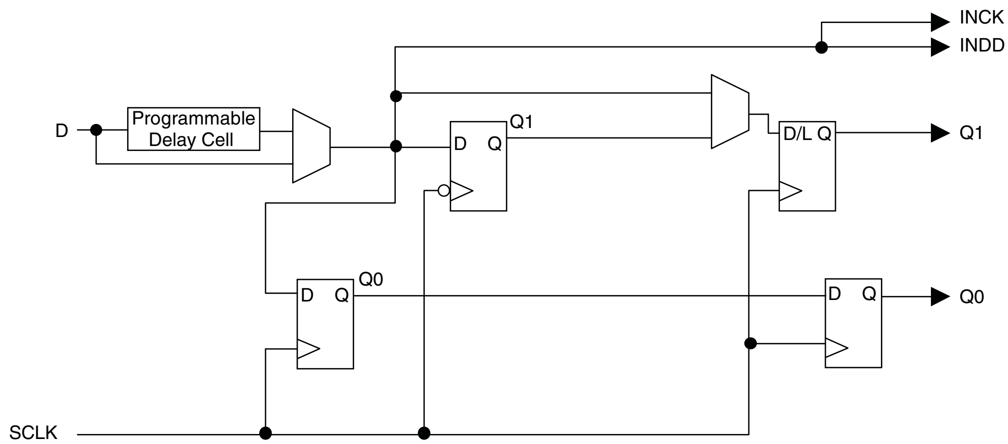
N = Address bit width.

The FIFO state machine supports two types of reset signals: RST and RPRST. The RST signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset state. The RPRST signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

Memory Core Reset

The memory core contains data output latches for ports A and B. These are simple latches that can be reset synchronously or asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with port A and port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-9.

Figure 2-12. MachXO2 Input Register Block Diagram (PIO on Left, Top and Bottom Edges)



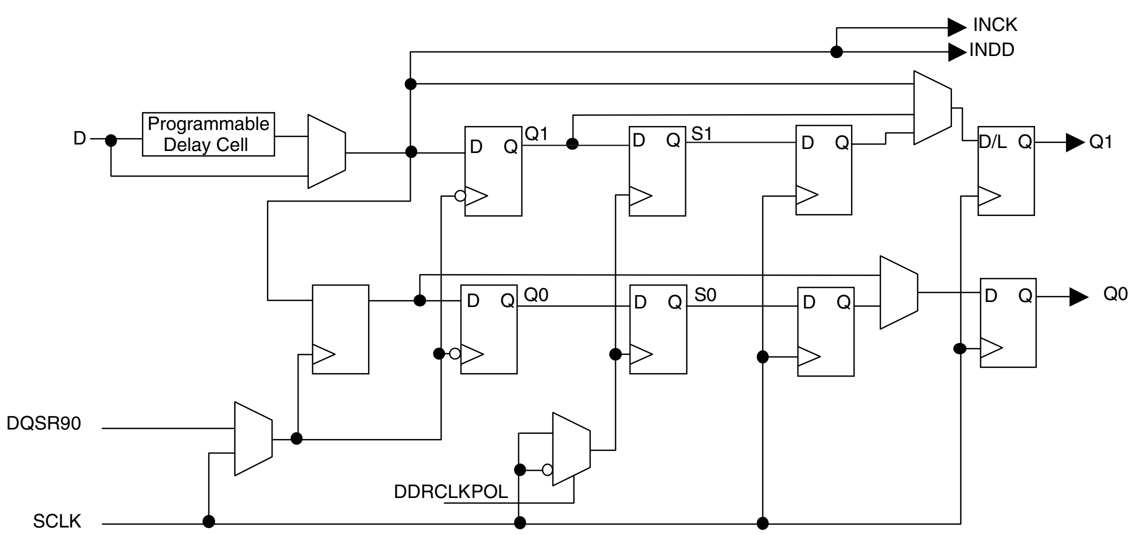
Right Edge

The input register block on the right edge is a superset of the same block on the top, bottom, and left edges. In addition to the modes described above, the input register block on the right edge also supports DDR memory mode.

In DDR memory mode, two registers are used to sample the data on the positive and negative edges of the modified DQS (DQSR90) in the DDR Memory mode creating two data streams. Before entering the core, these two data streams are synchronized to the system clock to generate two data streams.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred to the system clock domain from the DQS domain. The DQSR90 and DDRCLKPOL signals are generated in the DQS read-write block.

Figure 2-13. MachXO2 Input Register Block Diagram (PIO on Right Edge)



More information on the input gearbox is available in TN1203, Implementing High-Speed Interfaces with MachXO2 Devices.

Output Gearbox

Each PIC on the top edge has a built-in 8:1 output gearbox. Each of these output gearboxes may be programmed as a 7:1 serializer or as one ODDRX4 (8:1) gearbox or as two ODDRX2 (4:1) gearboxes. Table 2-10 shows the gearbox signals.

Table 2-10. Output Gearbox Signal List

Name	I/O Type	Description
Q	Output	High-speed data output
D[7:0]	Input	Low-speed data from device core
Video TX(7:1): D[6:0]		
GDDRX4(8:1): D[7:0]		
GDDRX2(4:1)(IOL-A): D[3:0]		
GDDRX2(4:1)(IOL-C): D[7:4]		
SCLK	Input	Slow-speed system clock
ECLK [1:0]	Input	High-speed edge clock
RST	Input	Reset

The gearboxes have three stage pipeline registers. The first stage registers sample the low-speed input data on the low-speed system clock. The second stage registers transfer data from the low-speed clock registers to the high-speed clock registers. The third stage pipeline registers controlled by high-speed edge clock shift and mux the high-speed data out to the sysIO buffer. Figure 2-17 shows the output gearbox block diagram.

MachXO2-640U, MachXO2-1200/U, MachXO2-2000/U, MachXO2-4000 and MachXO2-7000 devices contain three types of sysIO buffer pairs.

1. **Left and Right sysIO Buffer Pairs**
   The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the left and right of the devices also have differential and referenced input buffers.

2. **Bottom sysIO Buffer Pairs**
   The sysIO buffer pairs in the bottom bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the bottom also have differential and referenced input buffers. Only the I/Os on the bottom banks have programmable PCI clamps and differential input termination. The PCI clamp is enabled after V_{CC} and V_{CCIO} are at valid operating levels and the device has been configured.

3. **Top sysIO Buffer Pairs**
   The sysIO buffer pairs in the top bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the top also have differential and referenced I/O buffers. Half of the sysIO buffer pairs on the top edge have true differential outputs. The sysIO buffer pair comprising of the A and B PIOs in every PIC on the top edge have a differential output driver. The referenced input buffer can also be configured as a differential input buffer.

Typical I/O Behavior During Power-up

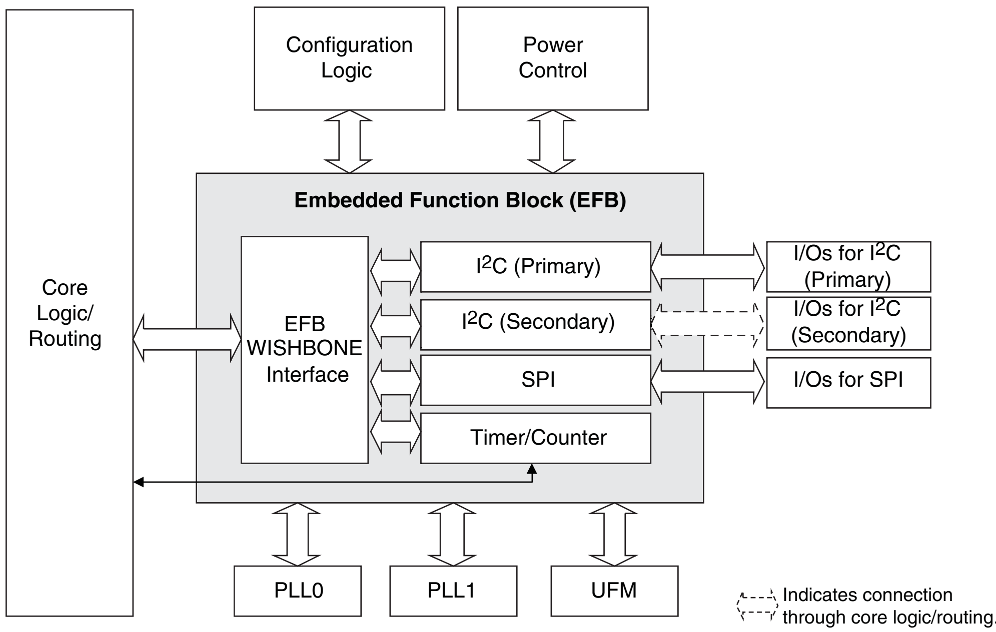
The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCIO0} have reached V_{PORUP} level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-down to GND (some pins such as PROGRAMN and the JTAG pins have weak pull-up to V_{CCIO} as the default functionality). The I/O pins will maintain the blank configuration until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached V_{PORUP} levels at which time the I/Os will take on the user-configured settings only after a proper download/configuration.

Supported Standards

The MachXO2 sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS, LVTTL, and PCI. The buffer supports the LVTTL, PCI, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3 V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS, MLVDS and LVPECL output emulation is supported on all devices. The MachXO2-640U, MachXO2-1200/U and higher devices support on-chip LVDS output buffers on approximately 50% of the I/Os on the top bank. Differential receivers for LVDS, BLVDS, MLVDS and LVPECL are supported on all banks of MachXO2 devices. PCI support is provided in the bottom bank of theMachXO2-640U, MachXO2-1200/U and higher density devices. Table 2-11 summarizes the I/O characteristics of the MachXO2 PLDs.

Tables 2-11 and 2-12 show the I/O standards (together with their supply and reference voltages) supported by the MachXO2 devices. For further information on utilizing the sysIO buffer to support a variety of standards please see TN1202, MachXO2 sysIO Usage Guide.

Figure 2-20. Embedded Function Block Interface



Hardened I²C IP Core

Every MachXO2 device contains two I²C IP cores. These are the primary and secondary I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I²C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Up to 400 kHz data transfer speed
- General call support
- Interface to custom logic through 8-bit WISHBONE interface

Figure 2-21. I²C Core Block Diagram

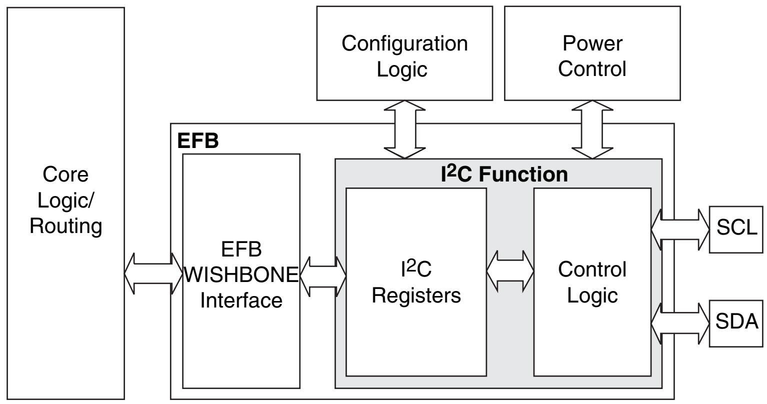


Table 2-15 describes the signals interfacing with the I²C cores.

Table 2-15. I²C Core Signal Description

Signal Name	I/O	Description
i2c_scl	Bi-directional	Bi-directional clock line of the I²C core. The signal is an output if the I²C core is in master mode. The signal is an input if the I²C core is in slave mode. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I²C ports in each MachXO2 device.
i2c_sda	Bi-directional	Bi-directional data line of the I²C core. The signal is an output when data is transmitted from the I²C core. The signal is an input when data is received into the I²C core. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I²C ports in each MachXO2 device.
i2c_irqo	Output	Interrupt request output signal of the I²C core. The intended usage of this signal is for it to be connected to the WISHBONE master controller (i.e. a microcontroller or state machine) and request an interrupt when a specific condition is met. These conditions are described with the I²C register definitions.
cfg_wake	Output	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, I²C Tab.
cfg_stdby	Output	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, I²C Tab.

Hardened SPI IP Core

Every MachXO2 device has a hard SPI IP core that can be configured as a SPI master or slave. When the IP core is configured as a master it will be able to control other SPI enabled chips connected to the SPI bus. When the core is configured as the slave, the device will be able to interface to an external SPI master. The SPI IP core on MachXO2 devices supports the following functions:

- Configurable Master and Slave modes
- Full-Duplex data transfer
- Mode fault error flag with CPU interrupt capability
- Double-buffered data register
- Serial clock with programmable polarity and phase
- LSB First or MSB First Data Transfer
- Interface to custom logic through 8-bit WISHBONE interface

Input/Output Standard	V_{IL}		V_{IH}		V_{OL} Max. (V)	V_{OH} Min. (V)	I_{OL} Max.[4] (mA)	I_{OH} Max.[4] (mA)
	Min. (V)[3]	Max. (V)	Min. (V)	Max. (V)				
LVCMOS10R25	–0.3	V_{REF} – 0.1	V_{REF} + 0.1	3.6	0.40	NA Open Drain	16, 12, 8, 4	NA Open Drain

1. MachXO2 devices allow LVCMOS inputs to be placed in I/O banks where V_{CCIO} is different from what is specified in the applicable JEDEC specification. This is referred to as a ratioed input buffer. In a majority of cases this operation follows or exceeds the applicable JEDEC specification. The cases where MachXO2 devices do not meet the relevant JEDEC specification are documented in the table below.
2. MachXO2 devices allow for LVCMOS referenced I/Os which follow applicable JEDEC specifications. For more details about mixed mode operation please refer to please refer to TN1202, MachXO2 sysIO Usage Guide.
3. The dual function I^2C pins SCL and SDA are limited to a V_{IL} min of –0.25 V or to –0.3 V with a duration of <10 ns.
4. For electromigration, the average DC current sourced or sinked by I/O pads between two consecutive VCCIO or GND pad connections, or between the last VCCIO or GND in an I/O bank and the end of an I/O bank, as shown in the Logic Signal Connections table (also shown as I/O grouping) shall not exceed a maximum of n * 8 mA. "n" is the number of I/O pads between the two consecutive bank VCCIO or GND connections or between the last VCCIO and GND in a bank and the end of a bank. IO Grouping can be found in the Data Sheet Pin Tables, which can also be generated from the Lattice Diamond software.

Input Standard	V_{CCIO} (V)	V_{IL} Max. (V)
LVCMOS 33	1.5	0.685
LVCMOS 25	1.5	0.687
LVCMOS 18	1.5	0.655

sysIO Differential Electrical Characteristics

The LVDS differential output buffers are available on the top side of MachXO2-640U, MachXO2-1200/U and higher density devices in the MachXO2 PLD family.

LVDS

Over Recommended Operating Conditions

Parameter Symbol	Parameter Description	Test Conditions	Min.	Typ.	Max.	Units
V_{INP}, V_{INM}	Input Voltage	V_{CCIO} = 3.3 V	0	—	2.605	V
		V_{CCIO} = 2.5 V	0	—	2.05	V
V_{THD}	Differential Input Threshold		±100	—		mV
V_{CM}	Input Common Mode Voltage	V_{CCIO} = 3.3 V	0.05	—	2.6	V
		V_{CCIO} = 2.5 V	0.05	—	2.0	V
I_{IN}	Input current	Power on	—	—	±10	µA
V_{OH}	Output high voltage for V_{OP} or V_{OM}	R_T = 100 Ohm	—	1.375	—	V

f_{DDRX4}	DDRX4 ECLK Frequency		—	210	—	176	—	146	MHz
f_{SCLK}	SCLK Frequency		—	53	—	44	—	37	MHz

sysCONFIG Port Timing Specifications

Symbol	Parameter		Min.	Max.	Units
All Configuration Modes					
t_{PRGM}	PROGRAMN low pulse accept		55	—	ns
t_{PRGMJ}	PROGRAMN low pulse rejection		—	25	ns
t_{INITL}	INITN low time	LCMXO2-256	—	30	µs
		LCMXO2-640	—	35	µs
		LCMXO2-640U/ LCMXO2-1200	—	55	µs
		LCMXO2-1200U/ LCMXO2-2000	—	70	µs
		LCMXO2-2000U/ LCMXO2-4000	—	105	µs
		LCMXO2-7000	—	130	µs
$t_{DPPINIT}$	PROGRAMN low to INITN low		—	150	ns
$t_{DPPDONE}$	PROGRAMN low to DONE low		—	150	ns
t_{IODISS}	PROGRAMN low to I/O disable		—	120	ns
Slave SPI					
f_{MAX}	CCLK clock frequency		—	66	MHz
t_{CCLKH}	CCLK clock pulse width high		7.5	—	ns
t_{CCLKL}	CCLK clock pulse width low		7.5	—	ns
t_{STSU}	CCLK setup time		2	—	ns
t_{STH}	CCLK hold time		0	—	ns
t_{STCO}	CCLK falling edge to valid output		—	10	ns
t_{STOZ}	CCLK falling edge to valid disable		—	10	ns
t_{STOV}	CCLK falling edge to valid enable		—	10	ns
t_{SCS}	Chip select high time		25	—	ns
t_{SCSS}	Chip select setup time		3	—	ns
t_{SCSH}	Chip select hold time		3	—	ns
Master SPI					
f_{MAX}	MCLK clock frequency		—	133	MHz
t_{MCLKH}	MCLK clock pulse width high		3.75	—	ns
t_{MCLKL}	MCLK clock pulse width low		3.75	—	ns
t_{STSU}	MCLK setup time		5	—	ns
t_{STH}	MCLK hold time		1	—	ns
t_{CSSPI}	INITN high to chip select low		100	200	ns
t_{MCLK}	INITN high to first MCLK edge		0.75	1	µs

I²C Port Timing Specifications[1, 2]

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	Maximum SCL clock frequency	—	400	kHz

1. MachXO2 supports the following modes:
   - Standard-mode (Sm), with a bit rate up to 100 kbit/s (user and configuration mode)
   - Fast-mode (Fm), with a bit rate up to 400 kbit/s (user and configuration mode)
2. Refer to the I²C specification for timing requirements.

SPI Port Timing Specifications[1]

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	Maximum SCK clock frequency	—	45	MHz

1. Applies to user mode only. For configuration mode timing specifications, refer to sysCONFIG Port Timing Specifications table in this data sheet.

Switching Test Conditions

Figure 3-13 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-5.

Figure 3-13. Output Test Load, LVTTL and LVCMOS Standards

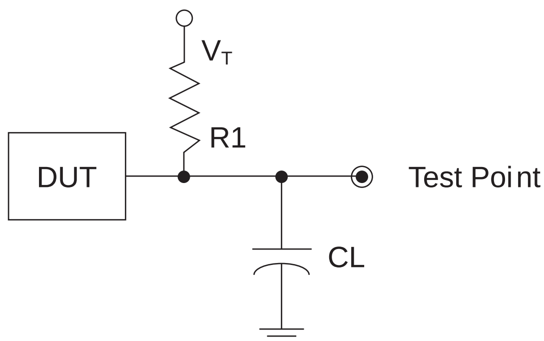

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R1	CL	Timing Ref.	VT
LVTTL and LVCMOS settings (L -> H, H -> L)	∞	0pF	LVTTL, LVCMOS 3.3 = 1.5 V	—
			LVCMOS 2.5 = $V_{CCIO}/2$	—
			LVCMOS 1.8 = $V_{CCIO}/2$	—
			LVCMOS 1.5 = $V_{CCIO}/2$	—
			LVCMOS 1.2 = $V_{CCIO}/2$	—
LVTTL and LVCMOS 3.3 (Z -> H)	188	0pF	1.5 V	V_{OL}
LVTTL and LVCMOS 3.3 (Z -> L)			1.5 V	V_{OH}
Other LVCMOS (Z -> H)			$V_{CCIO}/2$	V_{OL}
Other LVCMOS (Z -> L)			$V_{CCIO}/2$	V_{OH}
LVTTL + LVCMOS (H -> Z)			V_{OH} – 0.15 V	V_{OL}
LVTTL + LVCMOS (L -> Z)			V_{OL} – 0.15 V	V_{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

1. Specifications for the “LCMXO2-1200HC-speed package IR1” are the same as the “LCMXO2-1200ZE-speed package I” devices respectively, except as specified in the R1 Device Specifications section of this data sheet.

Date	Version	Section	Change Summary
February 2012	01.7	All	Updated document with new corporate logo.
	01.6	—	Data sheet status changed from preliminary to final.
		Introduction	MachXO2 Family Selection Guide table – Removed references to 49-ball WLCSP.
		DC and Switching Characteristics	Updated Flash Download Time table.
			Modified Storage Temperature in the Absolute Maximum Ratings section.
			Updated I_{DK} max in Hot Socket Specifications table.
			Modified Static Supply Current tables for ZE and HC/HE devices.
			Updated Power Supply Ramp Rates table.
			Updated Programming and Erase Supply Current tables.
			Updated data in the External Switching Characteristics table.
			Corrected Absolute Maximum Ratings for Dedicated Input Voltage Applied for LCMXO2 HC.
			DC Electrical Characteristics table – Minor corrections to conditions for I_{IL}, I_{IH}.
		Pinout Information	Removed references to 49-ball WLCSP.
			Signal Descriptions table – Updated description for GND, VCC, and VCCIOx.
			Updated Pin Information Summary table – Number of VCCIOs, GNDs, VCCs, and Total Count of Bonded Pins for MachXO2-256, 640, and 640U and Dual Function I/O for MachXO2-4000 332caBGA.
		Ordering Information	Removed references to 49-ball WLCSP
August 2011	01.5	DC and Switching Characteristics	Updated ESD information.
		Ordering Information	Updated footnote for ordering WLCSP devices.
	01.4	Architecture	Updated information in Clock/Control Distribution Network and sysCLOCK Phase Locked Loops (PLLs).
		DC and Switching Characteristics	Updated I_{IL} and I_{IH} conditions in the DC Electrical Characteristics table.
		Pinout Information	Included number of 7:1 and 8:1 gearboxes (input and output) in the pin information summary tables.
			Updated Pin Information Summary table: Dual Function I/O, DQS Groups Bank 1, Total General Purpose Single-Ended I/O, Differential I/O Per Bank, Total Count of Bonded Pins, Gearboxes. Added column of data for MachXO2-2000 49 WLCSP.
		Ordering Information	Updated R1 Device Specifications text section with information on migration from MachXO2-1200-R1 to Standard (non-R1) devices.
			Corrected Supply Voltage typo for part numbers: LCMX02-2000UHE-4FG484I, LCMX02-2000UHE-5FG484I, LCMX02-2000UHE-6FG484I.
			Added footnote for WLCSP package parts.
		Supplemental Information	Removed reference to Stand-alone Power Calculator for MachXO2 Devices. Added reference to AN8086, Designing for Migration from MachXO2-1200-R1 to Standard (non-R1) Devices.
