

Welcome to [E-XFL.COM](#)

[Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	274
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	332-FBGA
Supplier Device Package	332-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-4000hc-5bg332i

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO2 devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO2 devices, please see TN1201, [Memory Usage Guide for MachXO2 Devices](#).

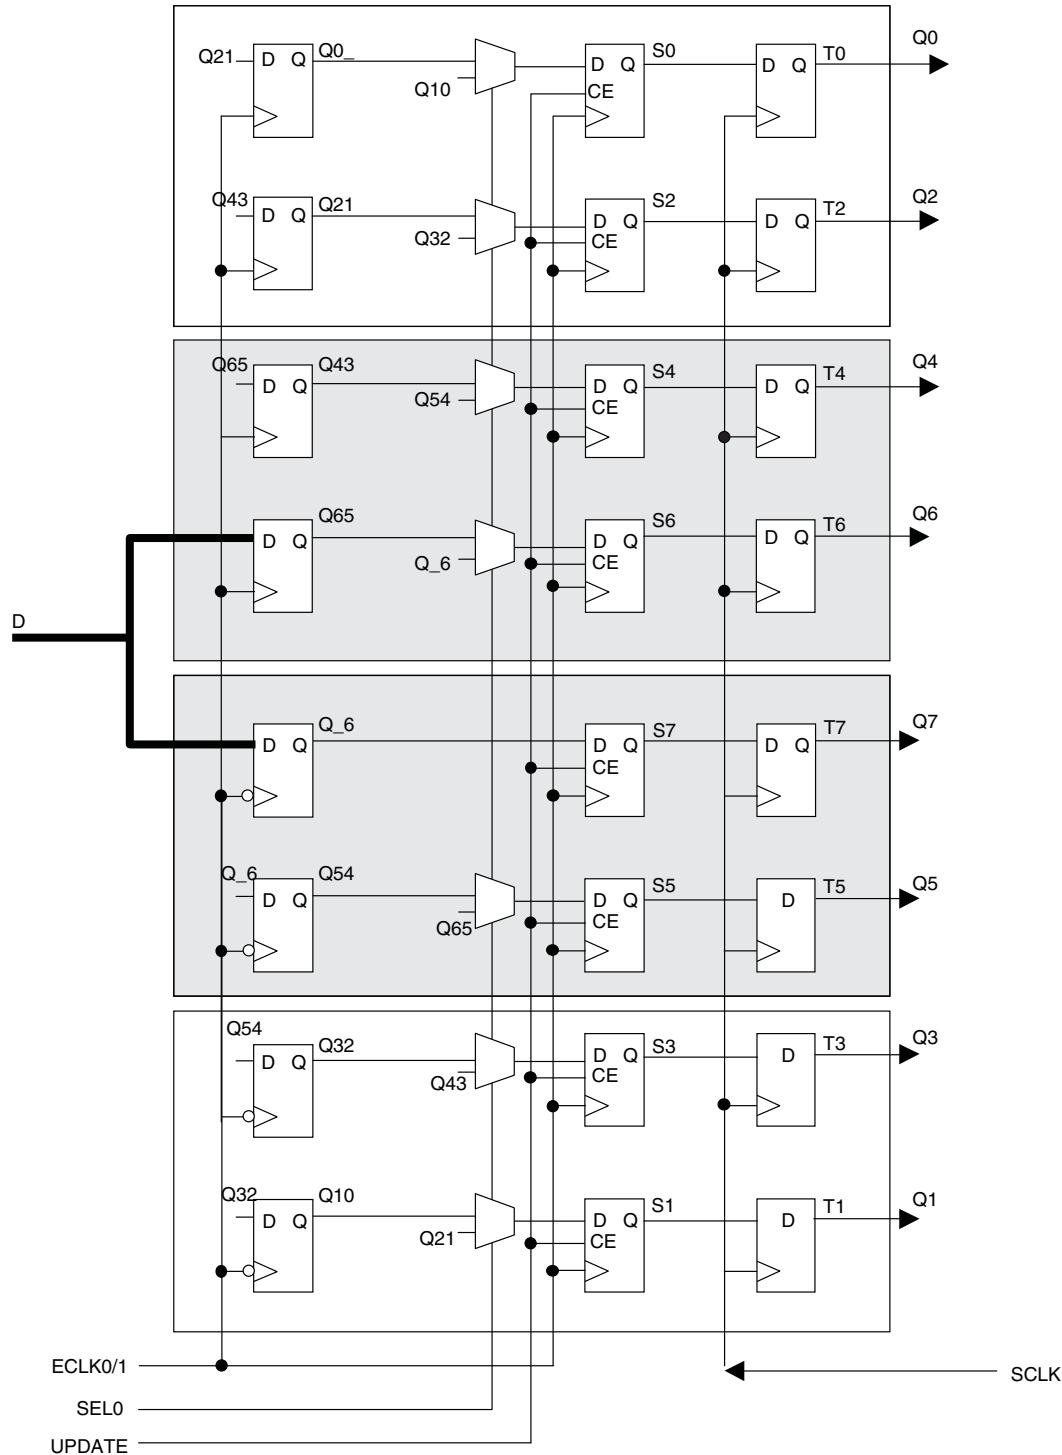

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

These gearboxes have three stage pipeline registers. The first stage registers sample the high-speed input data by the high-speed edge clock on its rising and falling edges. The second stage registers perform data alignment based on the control signals UPDATE and SEL0 from the control block. The third stage pipeline registers pass the data to the device core synchronized to the low-speed system clock. Figure 2-16 shows a block diagram of the input gearbox.

Figure 2-16. Input Gearbox

More information on the input gearbox is available in TN1203, [Implementing High-Speed Interfaces with MachXO2 Devices](#).

Output Gearbox

Each PIC on the top edge has a built-in 8:1 output gearbox. Each of these output gearboxes may be programmed as a 7:1 serializer or as one ODDRX4 (8:1) gearbox or as two ODDRX2 (4:1) gearboxes. Table 2-10 shows the gearbox signals.

Table 2-10. Output Gearbox Signal List

Name	I/O Type	Description
Q	Output	High-speed data output
D[7:0]	Input	Low-speed data from device core
Video TX(7:1): D[6:0]		
GDDRX4(8:1): D[7:0]		
GDDRX2(4:1)(IOL-A): D[3:0]		
GDDRX2(4:1)(IOL-C): D[7:4]		
SCLK	Input	Slow-speed system clock
ECLK [1:0]	Input	High-speed edge clock
RST	Input	Reset

The gearboxes have three stage pipeline registers. The first stage registers sample the low-speed input data on the low-speed system clock. The second stage registers transfer data from the low-speed clock registers to the high-speed clock registers. The third stage pipeline registers controlled by high-speed edge clock shift and mux the high-speed data out to the sysIO buffer. Figure 2-17 shows the output gearbox block diagram.

DDR Memory Support

Certain PICs on the right edge of MachXO2-640U, MachXO2-1200/U and larger devices, have additional circuitry to allow the implementation of DDR memory interfaces. There are two groups of 14 or 12 PIOs each on the right edge with additional circuitry to implement DDR memory interfaces. This capability allows the implementation of up to 16-bit wide memory interfaces. One PIO from each group contains a control element, the DQS Read/Write Block, to facilitate the generation of clock and control signals (DQSR90, DQSW90, DDRCLKPOL and DATAVALID). These clock and control signals are distributed to the other PIO in the group through dedicated low skew routing.

DQS Read Write Block

Source synchronous interfaces generally require the input clock to be adjusted in order to correctly capture data at the input register. For most interfaces a PLL is used for this adjustment. However, in DDR memories the clock (referred to as DQS) is not free-running so this approach cannot be used. The DQS Read Write block provides the required clock alignment for DDR memory interfaces. DQSR90 and DQSW90 signals are generated by the DQS Read Write block from the DQS input.

In a typical DDR memory interface design, the phase relationship between the incoming delayed DQS strobe and the internal system clock (during the read cycle) is unknown. The MachXO2 family contains dedicated circuits to transfer data between these domains. To prevent set-up and hold violations, at the domain transfer between DQS (delayed) and the system clock, a clock polarity selector is used. This circuit changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of each read cycle for the correct clock polarity. Prior to the read operation in DDR memories, DQS is in tri-state (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit in the DQS Read Write block detects the first DQS rising edge after the preamble state and generates the DDRCLKPOL signal. This signal is used to control the polarity of the clock to the synchronizing registers.

The temperature, voltage and process variations of the DQS delay block are compensated by a set of calibration signals (6-bit bus) from a DLL on the right edge of the device. The DLL loop is compensated for temperature, voltage and process variations by the system clock and feedback loop.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems including LVCMOS, TTL, PCI, SSTL, HSTL, LVDS, BLVDS, MLVDS and LVPECL.

Each bank is capable of supporting multiple I/O standards. In the MachXO2 devices, single-ended output buffers, ratioed input buffers (LVTTI, LVCMOS and PCI), differential (LVDS) and referenced input buffers (SSTL and HSTL) are powered using I/O supply voltage (V_{CCIO}). Each sysIO bank has its own V_{CCIO} . In addition, each bank has a voltage reference, V_{REF} which allows the use of referenced input buffers independent of the bank V_{CCIO} .

MachXO2-256 and MachXO2-640 devices contain single-ended ratioed input buffers and single-ended output buffers with complementary outputs on all the I/O banks. Note that the single-ended input buffers on these devices do not contain PCI clamps. In addition to the single-ended I/O buffers these two devices also have differential and referenced input buffers on all I/Os. The I/Os are arranged in pairs, the two pads in the pair are described as "T" and "C", where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, [Minimizing System Interruption During Configuration Using TransFR Technology](#) (Appendix B)
- TN1205, [Using User Flash Memory and Hardened Control Functions in MachXO2 Devices](#)

Figure 2-22. SPI Core Block Diagram

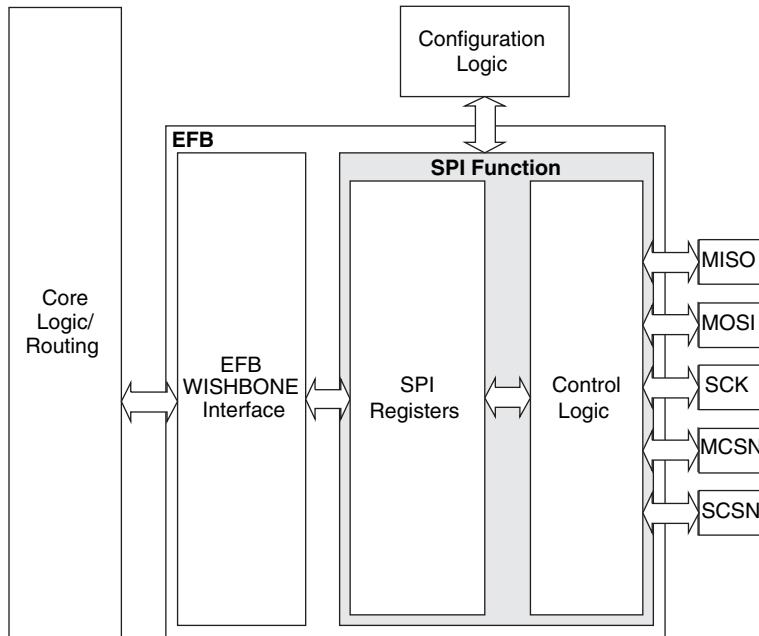

Table 2-16 describes the signals interfacing with the SPI cores.

Table 2-16. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
ufm_sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the User Flash Memory (UFM).
cfg_stby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.

Table 2-18. MachXO2 Power Saving Features Description

Device Subsystem	Feature Description
Bandgap	The bandgap can be turned off in standby mode. When the Bandgap is turned off, analog circuitry such as the POR, PLLs, on-chip oscillator, and referenced and differential I/O buffers are also turned off. Bandgap can only be turned off for 1.2 V devices.
Power-On-Reset (POR)	The POR can be turned off in standby mode. This monitors VCC levels. In the event of unsafe V_{CC} drops, this circuit reconfigures the device. When the POR circuitry is turned off, limited power detector circuitry is still active. This option is only recommended for applications in which the power supply rails are reliable.
On-Chip Oscillator	The on-chip oscillator has two power saving features. It may be switched off if it is not needed in your design. It can also be turned off in Standby mode.
PLL	Similar to the on-chip oscillator, the PLL also has two power saving features. It can be statically switched off if it is not needed in a design. It can also be turned off in Standby mode. The PLL will wait until all output clocks from the PLL are driven low before powering off.
I/O Bank Controller	Referenced and differential I/O buffers (used to implement standards such as HSTL, SSTL and LVDS) consume more than ratioed single-ended I/Os such as LVCMOS and LVTTL. The I/O bank controller allows the user to turn these I/Os off dynamically on a per bank selection.
Dynamic Clock Enable for Primary Clock Nets	Each primary clock net can be dynamically disabled to save power.
Power Guard	Power Guard is a feature implemented in input buffers. This feature allows users to switch off the input buffer when it is not needed. This feature can be used in both clock and data paths. Its biggest impact is that in the standby mode it can be used to switch off clock inputs that are distributed using general routing resources.

For more details on the standby mode refer to [TN1198, Power Estimation and Management for MachXO2 Devices](#).

Power On Reset

MachXO2 devices have power-on reset circuitry to monitor V_{CCINT} and V_{CCIO} voltage levels during power-up and operation. At power-up, the POR circuitry monitors V_{CCINT} and V_{CCIO0} (controls configuration) voltage levels. It then triggers download from the on-chip configuration Flash memory after reaching the V_{PORUP} level specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. For devices without voltage regulators (ZE and HE devices), V_{CCINT} is the same as the V_{CC} supply voltage. For devices with voltage regulators (HC devices), V_{CCINT} is regulated from the V_{CC} supply voltage. From this voltage reference, the time taken for configuration and entry into user mode is specified as Flash Download Time ($t_{REFRESH}$) in the DC and Switching Characteristics section of this data sheet. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration. Note that for HC devices, a separate POR circuit monitors external V_{CC} voltage in addition to the POR circuit that monitors the internal post-regulated power supply voltage level.

Once the device enters into user mode, the POR circuitry can optionally continue to monitor V_{CCINT} levels. If V_{CCINT} drops below $V_{PORDNBG}$ level (with the bandgap circuitry switched on) or below $V_{PORDNSRAM}$ level (with the bandgap circuitry switched off to conserve power) device functionality cannot be guaranteed. In such a situation the POR issues a reset and begins monitoring the V_{CCINT} and V_{CCIO} voltage levels. $V_{PORDNBG}$ and $V_{PORDNSRAM}$ are both specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet.

Note that once a ZE or HE device enters user mode, users can switch off the bandgap to conserve power. When the bandgap circuitry is switched off, the POR circuitry also shuts down. The device is designed such that a minimal, low power POR circuit is still operational (this corresponds to the $V_{PORDNSRAM}$ reset point described in the paragraph above). However this circuit is not as accurate as the one that operates when the bandgap is switched on. The low power POR circuit emulates an SRAM cell and is biased to trip before the vast majority of SRAM cells flip. If users are concerned about the V_{CC} supply dropping below V_{CC} (min) they should not shut down the bandgap or POR circuit.

Power-On-Reset Voltage Levels^{1, 2, 3, 4, 5}

Symbol	Parameter	Min.	Typ.	Max.	Units
V_{PORUP}	Power-On-Reset ramp up trip point (band gap based circuit monitoring V_{CCINT} and V_{CCIO0})	0.9	—	1.06	V
$V_{PORUPEXT}$	Power-On-Reset ramp up trip point (band gap based circuit monitoring external V_{CC} power supply)	1.5	—	2.1	V
$V_{PORDNBG}$	Power-On-Reset ramp down trip point (band gap based circuit monitoring V_{CCINT})	0.75	—	0.93	V
$V_{PORDNBGEXT}$	Power-On-Reset ramp down trip point (band gap based circuit monitoring V_{CC})	0.98	—	1.33	V
$V_{PORDNSRAM}$	Power-On-Reset ramp down trip point (SRAM based circuit monitoring V_{CCINT})	—	0.6	—	V
$V_{PORDNSRAMEXT}$	Power-On-Reset ramp down trip point (SRAM based circuit monitoring V_{CC})	—	0.96	—	V

1. These POR trip points are only provided for guidance. Device operation is only characterized for power supply voltages specified under recommended operating conditions.
2. For devices without voltage regulators V_{CCINT} is the same as the V_{CC} supply voltage. For devices with voltage regulators, V_{CCINT} is regulated from the V_{CC} supply voltage.
3. Note that V_{PORUP} (min.) and $V_{PORDNBG}$ (max.) are in different process corners. For any given process corner $V_{PORDNBG}$ (max.) is always 12.0 mV below V_{PORUP} (min.).
4. $V_{PORUPEXT}$ is for HC devices only. In these devices a separate POR circuit monitors the external V_{CC} power supply.
5. V_{CCIO0} does not have a Power-On-Reset ramp down trip point. V_{CCIO0} must remain within the Recommended Operating Conditions to ensure proper operation.

Programming/Erase Specifications

Symbol	Parameter	Min.	Max. ¹	Units
$N_{PROGCYC}$	Flash Programming cycles per $t_{RETENTION}$	—	10,000	Cycles
	Flash functional programming cycles	—	100,000	
$t_{RETENTION}$	Data retention at 100 °C junction temperature	10	—	Years
	Data retention at 85 °C junction temperature	20	—	

1. Maximum Flash memory reads are limited to 7.5E13 cycles over the lifetime of the product.

Hot Socketing Specifications^{1, 2, 3}

Symbol	Parameter	Condition	Max.	Units
I_{DK}	Input or I/O leakage Current	$0 < V_{IN} < V_{IH}$ (MAX)	+/-1000	µA

1. Insensitive to sequence of V_{CC} and V_{CCIO} . However, assumes monotonic rise/fall rates for V_{CC} and V_{CCIO} .
2. $0 < V_{CC} < V_{CC}$ (MAX), $0 < V_{CCIO} < V_{CCIO}$ (MAX).
3. I_{DK} is additive to I_{PU} , I_{PD} or I_{BH} .

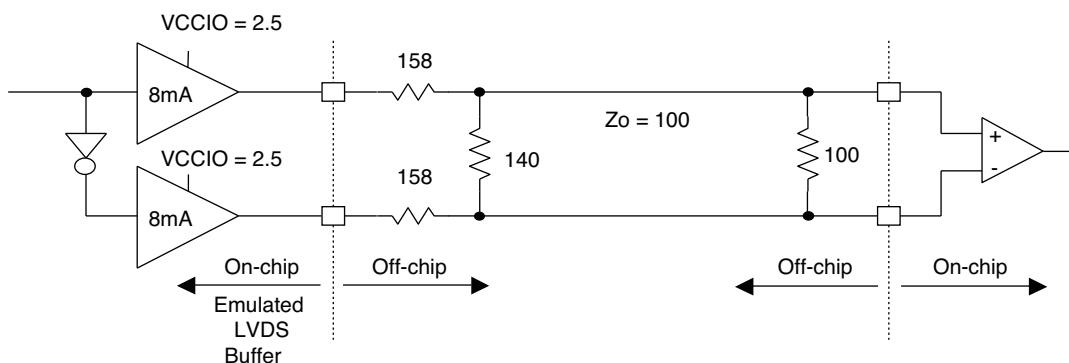

ESD Performance

Please refer to the [MachXO2 Product Family Qualification Summary](#) for complete qualification data, including ESD performance.

LVDS Emulation

MachXO2 devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Figure 3-1. LVDS Using External Resistors (LVDS25E)

Note: All resistors are $\pm 1\%$.

Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typ.	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	158	Ohms
R_P	Driver parallel resistor	140	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	6.03	mA

f _{DDR71}	DDR71 ECLK Frequency		—	210	—	176	—	146	MHz
f _{CLKIN}	7:1 Input Clock Frequency (SCLK) (minimum limited by PLL)		—	60	—	50	—	42	MHz
Generic DDR Outputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX1_TX.SCLK.Aligned^{9, 12}									
t _{DIA}	Output Data Invalid After CLK Output	All MachXO2 devices, all sides	—	0.850	—	0.910	—	0.970	ns
t _{DIB}	Output Data Invalid Before CLK Output		—	0.850	—	0.910	—	0.970	ns
f _{DATA}	DDRX1 Output Data Speed		—	140	—	116	—	98	Mbps
f _{DDRX1}	DDRX1 SCLK frequency		—	70	—	58	—	49	MHz
Generic DDR Outputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX1_TX.SCLK.Centered^{9, 12}									
t _{DVB}	Output Data Valid Before CLK Output	All MachXO2 devices, all sides	2.720	—	3.380	—	4.140	—	ns
t _{DVA}	Output Data Valid After CLK Output		2.720	—	3.380	—	4.140	—	ns
f _{DATA}	DDRX1 Output Data Speed		—	140	—	116	—	98	Mbps
f _{DDRX1}	DDRX1 SCLK Frequency (minimum limited by PLL)		—	70	—	58	—	49	MHz
Generic DDRX2 Outputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX2_TX.ECLK.Aligned^{9, 12}									
t _{DIA}	Output Data Invalid After CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only	—	0.270	—	0.300	—	0.330	ns
t _{DIB}	Output Data Invalid Before CLK Output		—	0.270	—	0.300	—	0.330	ns
f _{DATA}	DDRX2 Serial Output Data Speed		—	280	—	234	—	194	Mbps
f _{DDRX2}	DDRX2 ECLK frequency		—	140	—	117	—	97	MHz
f _{SCLK}	SCLK Frequency		—	70	—	59	—	49	MHz

Flash Download Time^{1,2}

Symbol	Parameter	Device	Typ.	Units
$t_{REFRESH}$	POR to Device I/O Active	LCMXO2-256	0.6	ms
		LCMXO2-640	1.0	ms
		LCMXO2-640U	1.9	ms
		LCMXO2-1200	1.9	ms
		LCMXO2-1200U	1.4	ms
		LCMXO2-2000	1.4	ms
		LCMXO2-2000U	2.4	ms
		LCMXO2-4000	2.4	ms
		LCMXO2-7000	3.8	ms

1. Assumes sysMEM EBR initialized to an all zero pattern if they are used.

2. The Flash download time is measured starting from the maximum voltage of POR trip point.

JTAG Port Timing Specifications

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	TCK clock frequency	—	25	MHz
t_{BTCPH}	TCK [BSCAN] clock pulse width high	20	—	ns

LCMXO2-7000HE-5FG484I	6864	1.2 V	-5	Halogen-Free fpBGA	484	IND
LCMXO2-7000HE-6FG484I	6864	1.2 V	-6	Halogen-Free fpBGA	484	IND

Date	Version	Section	Change Summary
December 2014	2.9	Introduction	Updated the Features section. Revised Table 1-1, MachXO2 Family Selection Guide. — Removed XO2-4000U data. — Removed 400-ball ftBGA. — Removed 25-ball WLCSP value for XO2-2000U.
		DC and Switching Characteristics	Updated the Recommended Operating Conditions section. Adjusted Max. values for V_{CC} and V_{CCIO} .
		Pinout Information	Updated the sysIO Recommended Operating Conditions section. Adjusted Max. values for LVCMOS 3.3, LVTTL, PCI, LVDS33 and LVPECL.
		Ordering Information	Updated the Pinout Information Summary section. Removed MachXO2-4000U.
			Updated the MachXO2 Part Number Description section. Removed BG400 package.
			Updated the High-Performance Commercial Grade Devices with Voltage Regulator, Halogen Free (RoHS) Packaging section. Removed LCMXO2-4000UHC part numbers.
November 2014	2.8	Introduction	Updated the Features section. — Revised I/Os under Flexible Logic Architecture. — Revised standby power under Ultra Low Power Devices. — Revise input frequency range under Flexible On-Chip Clocking.
			Updated Table 1-1, MachXO2 Family Selection Guide. — Added XO2-4000U data. — Removed HE and ZE device options for XO2-4000. — Added 400-ball ftBGA.
		Pinout Information	Updated the Pinout Information Summary section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400.
		Ordering Information	Updated the MachXO2 Part Number Description section. Added BG400 package.
			Updated the Ordering Information section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400 part numbers.
October 2014	2.7	Ordering Information	Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Fixed typo in LCMXO2-2000ZE-1UWG49ITR part number package.
		Architecture	Updated the Supported Standards section. Added MIPI information to Table 2-12. Supported Input Standards and Table 2-13. Supported Output Standards.
		DC and Switching Characteristics	Updated the BLVDS section. Changed output impedance nominal values in Table 3-2, BLVDS DC Condition.
			Updated the LVPECL section. Changed output impedance nominal value in Table 3-3, LVPECL DC Condition.
			Updated the sysCONFIG Port Timing Specifications section. Updated INITN low time values.
July 2014	2.6	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics ^{1,2} section. Updated footnote 4.
			Updated Register-to-Register Performance section. Updated footnote.
		Ordering Information	Updated UW49 package to UWG49 in MachXO2 Part Number Description.
			Updated LCMXO2-2000ZE-1UWG49CTR package in Ultra Low Power Commercial Grade Devices, Halogen Free (RoHS) Packaging.
