Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	274
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	332-FBGA
Supplier Device Package	332-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-4000he-4bg332c

Introduction

The MachXO2 family of ultra low power, instant-on, non-volatile PLDs has six devices with densities ranging from 256 to 6864 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic these devices feature Embedded Block RAM (EBR), Distributed RAM, User Flash Memory (UFM), Phase Locked Loops (PLLs), pre-engineered source synchronous I/O support, advanced configuration support including dual-boot capability and hardened versions of commonly used functions such as SPI controller, I2C controller and timer/counter. These features allow these devices to be used in low cost, high volume consumer and system applications.

The MachXO2 devices are designed on a 65 nm non-volatile low power process. The device architecture has several features such as programmable low swing differential I/Os and the ability to turn off I/O banks, on-chip PLLs and oscillators dynamically. These features help manage static and dynamic power consumption resulting in low static power for all members of the family.

The MachXO2 devices are available in two versions – ultra low power (ZE) and high performance (HC and HE) devices. The ultra low power devices are offered in three speed grades –1, –2 and –3, with –3 being the fastest. Similarly, the high-performance devices are offered in three speed grades: –4, –5 and –6, with –6 being the fastest. HC devices have an internal linear voltage regulator which supports external V_{CC} supply voltages of 3.3 V or 2.5 V. ZE and HE devices only accept 1.2 V as the external V_{CC} supply voltage. With the exception of power supply voltage all three types of devices (ZE, HC and HE) are functionally compatible and pin compatible with each other.

The MachXO2 PLDs are available in a broad range of advanced halogen-free packages ranging from the space saving 2.5 mm x 2.5 mm WLCSP to the 23 mm x 23 mm fpBGA. MachXO2 devices support density migration within the same package. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The pre-engineered source synchronous logic implemented in the MachXO2 device family supports a broad range of interface standards, including LPDDR, DDR, DDR2 and 7:1 gearing for display I/Os.

The MachXO2 devices offer enhanced I/O features such as drive strength control, slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a "per-pin" basis.

A user-programmable internal oscillator is included in MachXO2 devices. The clock output from this oscillator may be divided by the timer/counter for use as clock input in functions such as LED control, key-board scanner and similar state machines.

The MachXO2 devices also provide flexible, reliable and secure configuration from on-chip Flash memory. These devices can also configure themselves from external SPI Flash or be configured by an external master through the JTAG test access port or through the I2C port. Additionally, MachXO2 devices support dual-boot capability (using external Flash memory) and remote field upgrade (TransFR) capability.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the MachXO2 family of devices. Popular logic synthesis tools provide synthesis library support for MachXO2. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the MachXO2 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) LatticeCORE™ modules, including a number of reference designs licensed free of charge, optimized for the MachXO2 PLD family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

Figure 2-3. PFU Block Diagram
Slices

Slices 0-3 contain two LUT4s feeding two registers. Slices 0-2 can be configured as distributed memory. Table 2-1 shows the capability of the slices in PFU blocks along with the operation modes they enable. In addition, each PFU contains logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7 and LUT8. The control logic performs set/reset functions (programmable as synchronous/ asynchronous), clock select, chip-select and wider RAM/ROM functions.

Table 2-1. Resources and Modes Available per Slice

Slice	PFU Block	
	Resources	Modes
Slice 0	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 1	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 2	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 3	2 LUT4s and 2 Registers	Logic, Ripple, ROM

Figure 2-4 shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge triggered or level sensitive clocks. All slices have 15 inputs from routing and one from the carry-chain (from the adjacent slice or PFU). There are seven outputs: six for routing and one to carry-chain (to the adjacent PFU). Table 2-2 lists the signals associated with Slices 0-3.

Figure 2-4. Slice Diagram
For Slices 0 and 1, memory control signals are generated from Slice 2 as follows:
- WCK is CLK
- WRE is from LSR
- DI[3:2] for Slice 1 and DI[1:0] for Slice 0 data from Slice 2
- WAD [A:D] is a 4-bit address from slice 2 LUT input

Table 2-2. Slice Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0/M1	Multi-purpose input
Input	Control signal	CE	Clock enable
Input	Control signal	LSR	Local set/reset
Input	Control signal	CLK	System clock
Input	Inter-PFU signal	FCIN	Fast carry in[1]
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8[2] MUX depending on the slice
Output	Inter-PFU signal	FCO	Fast carry out[1]

1. See Figure 2-3 for connection details.
2. Requires two PFUs.

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Routing

There are many resources provided in the MachXO2 devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO2 device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

The MachXO2 architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO2-640U, MachXO2-1200/U and higher density devices have two edge clocks each on the top and bottom edges. Lower density devices have no edge clocks. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO2 devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO2 External Switching Characteristics table.

The primary clock signals for the MachXO2-256 and MachXO2-640 are generated from eight 17:1 muxes The available clock sources include eight I/O sources and 9 routing inputs. Primary clock signals for the MachXO2-640U, MachXO2-1200/U and larger devices are generated from eight 27:1 muxes The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sysCLOCK PLL outputs.

Table 2-11. I/O Support Device by Device

	MachXO2-256, MachXO2-640	MachXO2-640U, MachXO2-1200	MachXO2-1200U MachXO2-2000/U, MachXO2-4000, MachXO2-7000
Number of I/O Banks	4	4	6
Type of Input Buffers	Single-ended (all I/O banks) Differential Receivers (all I/O banks)	Single-ended (all I/O banks) Differential Receivers (all I/O banks) Differential input termination (bottom side)	Single-ended (all I/O banks) Differential Receivers (all I/O banks) Differential input termination (bottom side)
Types of Output Buffers	Single-ended buffers with complementary outputs (all I/O banks)	Single-ended buffers with complementary outputs (all I/O banks) Differential buffers with true LVDS outputs (50% on top side)	Single-ended buffers with complementary outputs (all I/O banks) Differential buffers with true LVDS outputs (50% on top side)
Differential Output Emulation Capability	All I/O banks	All I/O banks	All I/O banks
PCI Clamp Support	No	Clamp on bottom side only	Clamp on bottom side only

Table 2-12. Supported Input Standards

	VCCIO (Typ.)

Differential SSTL25	2.5
Differential HSTL18	1.8

1. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
2. These interfaces can be emulated with external resistors in all devices.

sysIO Buffer Banks

The numbers of banks vary between the devices of this family. MachXO2-1200U, MachXO2-2000/U and higher density devices have six I/O banks (one bank on the top, right and bottom side and three banks on the left side). The MachXO2-1200 and lower density devices have four banks (one bank per side). Figures 2-18 and 2-19 show the sysIO banks and their associated supplies for all devices.

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, Minimizing System Interruption During Configuration Using TransFR Technology (Appendix B)
- TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices

Figure 2-22. SPI Core Block Diagram
Table 2-16 describes the signals interfacing with the SPI cores.

Table 2-16. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
ufm_sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the User Flash Memory (UFM).
cfg_stdby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.

For more details on these embedded functions, please refer to TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices.

User Flash Memory (UFM)

MachXO2-640/U and higher density devices provide a User Flash Memory block, which can be used for a variety of applications including storing a portion of the configuration image, initializing EBRs, to store PROM data or, as a general purpose user Flash memory. The UFM block connects to the device core through the embedded function block WISHBONE interface. Users can also access the UFM block through the JTAG, I^{2}C and SPI interfaces of the device. The UFM block offers the following features:

- Non-volatile storage up to 256 kbits

- 100K write cycles

- Write access is performed page-wise; each page has 128 bits (16 bytes)

- Auto-increment addressing

- WISHBONE interface

For more information on the UFM, please refer to TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices.

Standby Mode and Power Saving Options

MachXO2 devices are available in three options for maximum flexibility: ZE, HC and HE devices. The ZE devices have ultra low static and dynamic power consumption. These devices use a 1.2 V core voltage that further reduces power consumption. The HC and HE devices are designed to provide high performance. The HC devices have a built-in voltage regulator to allow for 2.5 V V_{CC} and 3.3 V V_{CC} while the HE devices operate at 1.2 V V_{CC}.

MachXO2 devices have been designed with features that allow users to meet the static and dynamic power requirements of their applications by controlling various device subsystems such as the bandgap, power-on-reset circuitry, I/O bank controllers, power guard, on-chip oscillator, PLLs, etc. In order to maximize power savings, MachXO2 devices support an ultra low power Stand-by mode. While most of these features are available in all three device types, these features are mainly intended for use with MachXO2 ZE devices to manage power consumption.

In the stand-by mode the MachXO2 devices are powered on and configured. Internal logic, I/Os and memories are switched on and remain operational, as the user logic waits for an external input. The device enters this mode when the standby input of the standby controller is toggled or when an appropriate I^{2}C or JTAG instruction is issued by an external master. Various subsystems in the device such as the band gap, power-on-reset circuitry etc can be configured such that they are automatically turned "off" or go into a low power consumption state to save power when the device enters this state. Note that the MachXO2 devices are powered on when in standby mode and all power supplies should remain in the Recommended Operating Conditions.

March 2017   **Data Sheet DS1035**

Absolute Maximum Ratings[1, 2, 3]

	MachXO2 ZE/HE (1.2 V)	MachXO2 HC (2.5 V / 3.3 V)
Supply Voltage V_{CC}	–0.5 V to 1.32 V	–0.5 V to 3.75 V
Output Supply Voltage V_{CCIO}	–0.5 V to 3.75 V	–0.5 V to 3.75 V
I/O Tri-state Voltage Applied[4, 5]	–0.5 V to 3.75 V	–0.5 V to 3.75 V
Dedicated Input Voltage Applied[4]	–0.5 V to 3.75 V	–0.5 V to 3.75 V
Storage Temperature (Ambient)	–55 °C to 125 °C	–55 °C to 125 °C
Junction Temperature (T_J)	–40 °C to 125 °C	–40 °C to 125 °C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of –2 V to (V_{IHMAX} + 2) volts is permitted for a duration of <20 ns.
5. The dual function I²C pins SCL and SDA are limited to –0.25 V to 3.75 V or to –0.3 V with a duration of <20 ns.

Recommended Operating Conditions[1]

Symbol	Parameter	Min.	Max.	Units
V_{CC}[1]	Core Supply Voltage for 1.2 V Devices	1.14	1.26	V
	Core Supply Voltage for 2.5 V / 3.3 V Devices	2.375	3.6	V
V_{CCIO}[1, 2, 3]	I/O Driver Supply Voltage	1.14	3.6	V
t_{JCOM}	Junction Temperature Commercial Operation	0	85	°C
t_{JIND}	Junction Temperature Industrial Operation	–40	100	°C

1. Like power supplies must be tied together. For example, if V_{CCIO} and V_{CC} are both the same voltage, they must also be the same supply.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CCIO} pins of unused I/O banks should be connected to the V_{CC} power supply on boards.

Power Supply Ramp Rates[1]

Symbol	Parameter	Min.	Typ.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	0.01	—	100	V/ms

1. Assumes monotonic ramp rates.

Static Supply Current – ZE Devices[1, 2, 3, 6]

Symbol	Parameter	Device	Typ.[4]	Units
I_{CC}	Core Power Supply	LCMXO2-256ZE	18	µA
		LCMXO2-640ZE	28	µA
		LCMXO2-1200ZE	56	µA
		LCMXO2-2000ZE	80	µA
		LCMXO2-4000ZE	124	µA
		LCMXO2-7000ZE	189	µA
I_{CCIO}	Bank Power Supply[5] V_{CCIO} = 2.5 V	All devices	1	µA

1. For further information on supply current, please refer to TN1198, Power Estimation and Management for MachXO2 Devices.
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off. To estimate the impact of turning each of these items on, please refer to the following table or for more detail with your specific design use the Power Calculator tool.
3. Frequency = 0 MHz.
4. T_J = 25 °C, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO2 peak start-up current data, use the Power Calculator tool.

Static Power Consumption Contribution of Different Components – ZE Devices

The table below can be used for approximating static power consumption. For a more accurate power analysis for your design please use the Power Calculator tool.

Symbol	Parameter	Typ.	Units
I_{DCBG}	Bandgap DC power contribution	101	µA
I_{DCPOR}	POR DC power contribution	38	µA
$I_{DCIOBANKCONTROLLER}$	DC power contribution per I/O bank controller	143	µA

LVDS Emulation

MachXO2 devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Figure 3-1. LVDS Using External Resistors (LVDS25E)

Note: All resistors are ±1%.
Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typ.	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	158	Ohms
R_P	Driver parallel resistor	140	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	6.03	mA

Typical Building Block Function Performance – HC/HE Devices[1]

Pin-to-Pin Performance (LVCMOS25 12 mA Drive)

Function	-6 Timing	Units
Basic Functions		
16-bit decoder	8.9	ns
4:1 MUX	7.5	ns
16:1 MUX	8.3	ns

Register-to-Register Performance

Function	-6 Timing	Units
Basic Functions		
16:1 MUX	412	MHz
16-bit adder	297	MHz
16-bit counter	324	MHz
64-bit counter	161	MHz
Embedded Memory Functions		
1024x9 True-Dual Port RAM (Write Through or Normal, EBR output registers)	183	MHz
Distributed Memory Functions		
16x4 Pseudo-Dual Port RAM (one PFU)	500	MHz

1. The above timing numbers are generated using the Diamond design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.

Parameter	Description	Device	−3 Min.	−3 Max.	−2 Min.	−2 Max.	−1 Min.	−1 Max.	Units
Generic DDR4 Inputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX4_RX.ECLK.Centered[9, 12]									
t_{SU}	Input Data Setup Before ECLK	MachXO2-640U, MachXO2-1200/U and larger devices, bottom side only[11]	0.434	—	0.535	—	0.630	—	ns
t_{HO}	Input Data Hold After ECLK		0.385	—	0.395	—	0.463	—	ns
f_{DATA}	DDRX4 Serial Input Data Speed		—	420	—	352	—	292	Mbps
f_{DDRX4}	DDRX4 ECLK Frequency		—	210	—	176	—	146	MHz
f_{SCLK}	SCLK Frequency		—	53	—	44	—	37	MHz
7:1 LVDS Inputs – GDDR71_RX.ECLK.7.1[9, 12]									
t_{DVA}	Input Data Valid After ECLK	MachXO2-640U, MachXO2-1200/U and larger devices, bottom side only[11]	—	0.307	—	0.316	—	0.326	UI
t_{DVE}	Input Data Hold After ECLK		0.662	—	0.650	—	0.649	—	UI
f_{DATA}	DDR71 Serial Input Data Speed		—	420	—	352	—	292	Mbps
f_{DDR71}	DDR71 ECLK Frequency		—	210	—	176	—	146	MHz
f_{CLKIN}	7:1 Input Clock Frequency (SCLK) (minimum limited by PLL)		—	60	—	50	—	42	MHz
Generic DDR Outputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX1_TX.SCLK.Aligned[9, 12]									
t_{DIA}	Output Data Invalid After CLK Output	All MachXO2 devices, all sides	—	0.850	—	0.910	—	0.970	ns
t_{DIB}	Output Data Invalid Before CLK Output		—	0.850	—	0.910	—	0.970	ns
f_{DATA}	DDRX1 Output Data Speed		—	140	—	116	—	98	Mbps
f_{DDRX1}	DDRX1 SCLK frequency		—	70	—	58	—	49	MHz
Generic DDR Outputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX1_TX.SCLK.Centered[9, 12]									
t_{DVB}	Output Data Valid Before CLK Output	All MachXO2 devices, all sides	2.720	—	3.380	—	4.140	—	ns
t_{DVA}	Output Data Valid After CLK Output		2.720	—	3.380	—	4.140	—	ns
f_{DATA}	DDRX1 Output Data Speed		—	140	—	116	—	98	Mbps
f_{DDRX1}	DDRX1 SCLK Frequency (minimum limited by PLL)		—	70	—	58	—	49	MHz
Generic DDRX2 Outputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX2_TX.ECLK.Aligned[9, 12]									
t_{DIA}	Output Data Invalid After CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only	—	0.270	—	0.300	—	0.330	ns
t_{DIB}	Output Data Invalid Before CLK Output		—	0.270	—	0.300	—	0.330	ns
f_{DATA}	DDRX2 Serial Output Data Speed		—	280	—	234	—	194	Mbps
f_{DDRX2}	DDRX2 ECLK frequency		—	140	—	117	—	97	MHz
f_{SCLK}	SCLK Frequency		—	70	—	59	—	49	MHz

MachXO2 Oscillator Output Frequency

Symbol	Parameter	Min.	Typ.	Max	Units
f_{MAX}	Oscillator Output Frequency (Commercial Grade Devices, 0 to 85°C)	125.685	133	140.315	MHz
	Oscillator Output Frequency (Industrial Grade Devices, −40 °C to 100 °C)	124.355	133	141.645	MHz
t_{DT}	Output Clock Duty Cycle	43	50	57	%
t_{OPJIT}[1]	Output Clock Period Jitter	0.01	0.012	0.02	UIPP
$t_{STABLEOSC}$	STDBY Low to Oscillator Stable	0.01	0.05	0.1	µs

1. Output Clock Period Jitter specified at 133 MHz. The values for lower frequencies will be smaller UIPP. The typical value for 133 MHz is 95 ps and for 2.08 MHz the typical value is 1.54 ns.

MachXO2 Standby Mode Timing – HC/HE Devices

Symbol	Parameter	Device	Min.	Typ.	Max	Units

For Further Information

For further information regarding logic signal connections for various packages please refer to the MachXO2 Device Pinout Files.

Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Users must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the Thermal Management document to find the device/package specific thermal values.

For Further Information

For further information regarding Thermal Management, refer to the following:

- Thermal Management document

- TN1198, Power Estimation and Management for MachXO2 Devices

- The Power Calculator tool is included with the Lattice design tools, or as a standalone download from www.latticesemi.com/software
