Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	80
Number of Logic Elements/Cells	640
Total RAM Bits	18432
Number of I/O	79
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	132-LFBGA, CSPBGA
Supplier Device Package	132-CSPBGA (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-640hc-4mg132i

Architecture Overview

The MachXO2 family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). The larger logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO2-1200 Device

Note: MachXO2-256, and MachXO2-640/U are similar to MachXO2-1200. MachXO2-256 has a lower LUT count and no PLL or EBR blocks. MachXO2-640 has no PLL, a lower LUT count and two EBR blocks. MachXO2-640U has a lower LUT count, one PLL and seven EBR blocks.

Figure 2-2. Top View of the MachXO2-4000 Device

Note: MachXO2-1200U, MachXO2-2000/U and MachXO2-7000 are similar to MachXO2-4000. MachXO2-1200U and MachXO2-2000 have a lower LUT count, one PLL, and eight EBR blocks. MachXO2-2000U has a lower LUT count, two PLLs, and 10 EBR blocks. MachXO2-7000 has a higher LUT count, two PLLs, and 26 EBR blocks.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO2 family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks; these blocks are found in MachXO2-640/U and larger devices. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT usage.

The MachXO2 registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO2 architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks on MachXO2-640U, MachXO2-1200/U and larger devices. These blocks are located at the ends of the on-chip Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO2 devices provide commonly used hardened functions such as SPI controller, I²C controller and timer/counter. MachXO2-640/U and higher density devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I²C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO2 devices are available for operation from 3.3 V, 2.5 V and 1.2 V power supplies, providing easy integration into the overall system.

PFU Blocks

The core of the MachXO2 device consists of PFU blocks, which can be programmed to perform logic, arithmetic, distributed RAM and distributed ROM functions. Each PFU block consists of four interconnected slices numbered 0 to 3 as shown in Figure 2-3. Each slice contains two LUTs and two registers. There are 53 inputs and 25 outputs associated with each PFU block.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO2 devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO2 devices, please see TN1201, [Memory Usage Guide for MachXO2 Devices](#).

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Table 2-4. PLL Signal Descriptions (Continued)

Port Name	I/O	Description
CLKOP	O	Primary PLL output clock (with phase shift adjustment)
CLKOS	O	Secondary PLL output clock (with phase shift adjust)
CLKOS2	O	Secondary PLL output clock2 (with phase shift adjust)
CLKOS3	O	Secondary PLL output clock3 (with phase shift adjust)
LOCK	O	PLL LOCK, asynchronous signal. Active high indicates PLL is locked to input and feedback signals.
DPHSRC	O	Dynamic Phase source – ports or WISHBONE is active
STDBY	I	Standby signal to power down the PLL
RST	I	PLL reset without resetting the M-divider. Active high reset.
RESETM	I	PLL reset - includes resetting the M-divider. Active high reset.
RESETC	I	Reset for CLKOS2 output divider only. Active high reset.
RESETD	I	Reset for CLKOS3 output divider only. Active high reset.
ENCLKOP	I	Enable PLL output CLKOP
ENCLKOS	I	Enable PLL output CLKOS when port is active
ENCLKOS2	I	Enable PLL output CLKOS2 when port is active
ENCLKOS3	I	Enable PLL output CLKOS3 when port is active
PLLCLK	I	PLL data bus clock input signal
PLLIRST	I	PLL data bus reset. This resets only the data bus not any register values.
PLLSTB	I	PLL data bus strobe signal
PLLWE	I	PLL data bus write enable signal
PLLADDR [4:0]	I	PLL data bus address
PLLDATI [7:0]	I	PLL data bus data input
PLLDATO [7:0]	O	PLL data bus data output
PLLACK	O	PLL data bus acknowledge signal

sysMEM Embedded Block RAM Memory

The MachXO2-640/U and larger devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-kbit RAM, with dedicated input and output registers. This memory can be used for a wide variety of purposes including data buffering, PROM for the soft processor and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-5.

Table 2-5. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. EBR initialization data can be loaded from the UFM. To maximize the number of UFM bits, initialize the EBRs used in your design to an all-zero pattern. Initializing to an all-zero pattern does not use up UFM bits. MachXO2 devices have been designed such that multiple EBRs share the same initialization memory space if they are initialized to the same pattern.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual, Pseudo-Dual Port and FIFO Modes

Figure 2-8 shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

Figure 2-9. Memory Core Reset

For further information on the sysMEM EBR block, please refer to TN1201, [Memory Usage Guide for MachXO2 Devices](#).

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device wake up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-10. The reset timing rules apply to the RPRreset input versus the RE input and the RST input versus the WE and RE inputs. Both RST and RPRreset are always asynchronous EBR inputs. For more details refer to TN1201, [Memory Usage Guide for MachXO2 Devices](#).

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

These gearboxes have three stage pipeline registers. The first stage registers sample the high-speed input data by the high-speed edge clock on its rising and falling edges. The second stage registers perform data alignment based on the control signals UPDATE and SEL0 from the control block. The third stage pipeline registers pass the data to the device core synchronized to the low-speed system clock. Figure 2-16 shows a block diagram of the input gearbox.

2. These interfaces can be emulated with external resistors in all devices.

sysIO Buffer Banks

The numbers of banks vary between the devices of this family. MachXO2-1200U, MachXO2-2000/U and higher density devices have six I/O banks (one bank on the top, right and bottom side and three banks on the left side). The MachXO2-1200 and lower density devices have four banks (one bank per side). Figures 2-18 and 2-19 show the sysIO banks and their associated supplies for all devices.

BLVDS

The MachXO2 family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs. The input standard is supported by the LVDS differential input buffer. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example

1. This part number has a tape and reel quantity of 5,000 units with a minimum order quantity of 10,000 units. Order quantities must be in increments of 5,000 units. For example, a 10,000 unit order will be shipped in two reels with one reel containing 5,000 units and the other reel with less than 5,000 units (depending on test yields). Unserviced backlog will be canceled.
2. This part number has a tape and reel quantity of 1,000 units with a minimum order quantity of 1,000. Order quantities must be in increments of 1,000 units. For example, a 5,000 unit order will be shipped as 5 reels of 1000 units each.
3. This part number has a tape and reel quantity of 50 units with a minimum order quantity of 50. Order quantities must be in increments of 50 units. For example, a 1,000 unit order will be shipped as 20 reels of 50 units each.

Date	Version	Section	Change Summary
December 2014	2.9	Introduction	Updated the Features section. Revised Table 1-1, MachXO2 Family Selection Guide. — Removed XO2-4000U data. — Removed 400-ball ftBGA. — Removed 25-ball WLCSP value for XO2-2000U.
		DC and Switching Characteristics	Updated the Recommended Operating Conditions section. Adjusted Max. values for V_{CC} and V_{CCIO} . Updated the sysIO Recommended Operating Conditions section. Adjusted Max. values for LVCMOS 3.3, LVTTTL, PCI, LVDS33 and LVPECL.
		Pinout Information	Updated the Pinout Information Summary section. Removed MachXO2-4000U.
		Ordering Information	Updated the MachXO2 Part Number Description section. Removed BG400 package.
			Updated the High-Performance Commercial Grade Devices with Voltage Regulator, Halogen Free (RoHS) Packaging section. Removed LCMXO2-4000UHC part numbers. Updated the High-Performance Industrial Grade Devices with Voltage Regulator, Halogen Free (RoHS) Packaging section. Removed LCMXO2-4000UHC part numbers.
November 2014	2.8	Introduction	Updated the Features section. — Revised I/Os under Flexible Logic Architecture. — Revised standby power under Ultra Low Power Devices. — Revise input frequency range under Flexible On-Chip Clocking. Updated Table 1-1, MachXO2 Family Selection Guide. — Added XO2-4000U data. — Removed HE and ZE device options for XO2-4000. — Added 400-ball ftBGA.
			Updated the Pinout Information Summary section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400.
		Ordering Information	Updated the MachXO2 Part Number Description section. Added BG400 package.
			Updated the Ordering Information section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400 part numbers.
		Architecture	Updated the Supported Standards section. Added MIPI information to Table 2-12. Supported Input Standards and Table 2-13. Supported Output Standards.
October 2014	2.7	Ordering Information	Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Fixed typo in LCMXO2-2000ZE-1UWG49ITR part number package.
		DC and Switching Characteristics	Updated the BLVDS section. Changed output impedance nominal values in Table 3-2, BLVDS DC Condition. Updated the LVPECL section. Changed output impedance nominal value in Table 3-3, LVPECL DC Condition. Updated the sysCONFIG Port Timing Specifications section. Updated INITN low time values.
		Architecture	Updated the Supported Standards section. Added MIPI information to Table 2-12. Supported Input Standards and Table 2-13. Supported Output Standards.
July 2014	2.6	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics ^{1,2} section. Updated footnote 4. Updated Register-to-Register Performance section. Updated footnote.
			Updated UW49 package to UWG49 in MachXO2 Part Number Description.
		Ordering Information	Updated LCMXO2-2000ZE-1UWG49CTR package in Ultra Low Power Commercial Grade Devices, Halogen Free (RoHS) Packaging.
