Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	114
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmx02-7000hc-5tg144i

Introduction

The MachXO2 family of ultra low power, instant-on, non-volatile PLDs has six devices with densities ranging from 256 to 6864 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic these devices feature Embedded Block RAM (EBR), Distributed RAM, User Flash Memory (UFM), Phase Locked Loops (PLLs), pre-engineered source synchronous I/O support, advanced configuration support including dual-boot capability and hardened versions of commonly used functions such as SPI controller, I²C controller and timer/counter. These features allow these devices to be used in low cost, high volume consumer and system applications.

The MachXO2 devices are designed on a 65 nm non-volatile low power process. The device architecture has several features such as programmable low swing differential I/Os and the ability to turn off I/O banks, on-chip PLLs and oscillators dynamically. These features help manage static and dynamic power consumption resulting in low static power for all members of the family.

The MachXO2 devices are available in two versions – ultra low power (ZE) and high performance (HC and HE) devices. The ultra low power devices are offered in three speed grades –1, –2 and –3, with –3 being the fastest. Similarly, the high-performance devices are offered in three speed grades: –4, –5 and –6, with –6 being the fastest. HC devices have an internal linear voltage regulator which supports external V_{CC} supply voltages of 3.3 V or 2.5 V. ZE and HE devices only accept 1.2 V as the external V_{CC} supply voltage. With the exception of power supply voltage all three types of devices (ZE, HC and HE) are functionally compatible and pin compatible with each other.

The MachXO2 PLDs are available in a broad range of advanced halogen-free packages ranging from the space saving 2.5 mm x 2.5 mm WLCSP to the 23 mm x 23 mm fpBGA. MachXO2 devices support density migration within the same package. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The pre-engineered source synchronous logic implemented in the MachXO2 device family supports a broad range of interface standards, including LPDDR, DDR, DDR2 and 7:1 gearing for display I/Os.

The MachXO2 devices offer enhanced I/O features such as drive strength control, slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a “per-pin” basis.

A user-programmable internal oscillator is included in MachXO2 devices. The clock output from this oscillator may be divided by the timer/counter for use as clock input in functions such as LED control, key-board scanner and similar state machines.

The MachXO2 devices also provide flexible, reliable and secure configuration from on-chip Flash memory. These devices can also configure themselves from external SPI Flash or be configured by an external master through the JTAG test access port or through the I²C port. Additionally, MachXO2 devices support dual-boot capability (using external Flash memory) and remote field upgrade (TransFR) capability.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the MachXO2 family of devices. Popular logic synthesis tools provide synthesis library support for MachXO2. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the MachXO2 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) LatticeCORE™ modules, including a number of reference designs licensed free of charge, optimized for the MachXO2 PLD family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO2 devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO2 devices, please see TN1201, [Memory Usage Guide for MachXO2 Devices](#).

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Table 2-4. PLL Signal Descriptions (Continued)

Port Name	I/O	Description
CLKOP	O	Primary PLL output clock (with phase shift adjustment)
CLKOS	O	Secondary PLL output clock (with phase shift adjust)
CLKOS2	O	Secondary PLL output clock2 (with phase shift adjust)
CLKOS3	O	Secondary PLL output clock3 (with phase shift adjust)
LOCK	O	PLL LOCK, asynchronous signal. Active high indicates PLL is locked to input and feedback signals.
DPHSRC	O	Dynamic Phase source – ports or WISHBONE is active
STDBY	I	Standby signal to power down the PLL
RST	I	PLL reset without resetting the M-divider. Active high reset.
RESETM	I	PLL reset - includes resetting the M-divider. Active high reset.
RESETC	I	Reset for CLKOS2 output divider only. Active high reset.
RESETD	I	Reset for CLKOS3 output divider only. Active high reset.
ENCLKOP	I	Enable PLL output CLKOP
ENCLKOS	I	Enable PLL output CLKOS when port is active
ENCLKOS2	I	Enable PLL output CLKOS2 when port is active
ENCLKOS3	I	Enable PLL output CLKOS3 when port is active
PLLCLK	I	PLL data bus clock input signal
PLL_RST	I	PLL data bus reset. This resets only the data bus not any register values.
PLLSTB	I	PLL data bus strobe signal
PLLWE	I	PLL data bus write enable signal
PLLADDR [4:0]	I	PLL data bus address
PLLDAT_I [7:0]	I	PLL data bus data input
PLLDAT_O [7:0]	O	PLL data bus data output
PLLACK	O	PLL data bus acknowledge signal

sysMEM Embedded Block RAM Memory

The MachXO2-640/U and larger devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-kbit RAM, with dedicated input and output registers. This memory can be used for a wide variety of purposes including data buffering, PROM for the soft processor and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-5.

Table 2-5. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. EBR initialization data can be loaded from the UFM. To maximize the number of UFM bits, initialize the EBRs used in your design to an all-zero pattern. Initializing to an all-zero pattern does not use up UFM bits. MachXO2 devices have been designed such that multiple EBRs share the same initialization memory space if they are initialized to the same pattern.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual, Pseudo-Dual Port and FIFO Modes

Figure 2-8 shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

Figure 2-11. Group of Four Programmable I/O Cells

Notes:

1. Input gearbox is available only in PIC on the bottom edge of MachXO2-640U, MachXO2-1200/U and larger devices.
2. Output gearbox is available only in PIC on the top edge of MachXO2-640U, MachXO2-1200/U and larger devices.

Figure 2-12. MachXO2 Input Register Block Diagram (PIO on Left, Top and Bottom Edges)

Right Edge

The input register block on the right edge is a superset of the same block on the top, bottom, and left edges. In addition to the modes described above, the input register block on the right edge also supports DDR memory mode.

In DDR memory mode, two registers are used to sample the data on the positive and negative edges of the modified DQS (DQSR90) in the DDR Memory mode creating two data streams. Before entering the core, these two data streams are synchronized to the system clock to generate two data streams.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred to the system clock domain from the DQS domain. The DQSR90 and DDRCLKPOL signals are generated in the DQS read-write block.

Figure 2-13. MachXO2 Input Register Block Diagram (PIO on Right Edge)

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.

2. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.

3. Input on the bottom bank of the MachXO2-640U, MachXO2-1200/U and larger devices only.

4. Supported only for inputs and BIDs for all ZE devices, and –6 speed grade for HE and HC devices.

LVDS Emulation

MachXO2 devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

t _{STH}	MCLK hold time		1	—	ns
t _{CSSPI}	INITN high to chip select low		100	200	ns
t _{MCLK}	INITN high to first MCLK edge		0.75	1	μs

I²C Port Timing Specifications^{1, 2}

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCL clock frequency	—	400	kHz

- MachXO2 supports the following modes:
 - Standard-mode (Sm), with a bit rate up to 100 kbit/s (user and configuration mode)
 - Fast-mode (Fm), with a bit rate up to 400 kbit/s (user and configuration mode)
- Refer to the I²C specification for timing requirements.

SPI Port Timing Specifications¹

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCK clock frequency	—	45	MHz

- Applies to user mode only. For configuration mode timing specifications, refer to sysCONFIG Port Timing Specifications table in this data sheet.

Switching Test Conditions

Figure 3-13 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-5.

Figure 3-13. Output Test Load, LVTTTL and LVCMOS Standards

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R1	CL	Timing Ref.	VT
LVTTTL and LVCMOS settings (L -> H, H -> L)	∞	0pF	LVTTTL, LVCMOS 3.3 = 1.5 V	—
			LVCMOS 2.5 = V _{CCIO} /2	—
			LVCMOS 1.8 = V _{CCIO} /2	—
			LVCMOS 1.5 = V _{CCIO} /2	—
			LVCMOS 1.2 = V _{CCIO} /2	—
LVTTTL and LVCMOS 3.3 (Z -> H)	188	0pF	1.5 V	V _{OL}
LVTTTL and LVCMOS 3.3 (Z -> L)			1.5 V	V _{OH}
Other LVCMOS (Z -> H)			V _{CCIO} /2	V _{OL}
Other LVCMOS (Z -> L)			V _{CCIO} /2	V _{OH}
LVTTTL + LVCMOS (H -> Z)			V _{OH} - 0.15 V	V _{OL}
LVTTTL + LVCMOS (L -> Z)			V _{OL} - 0.15 V	V _{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

Date	Version	Section	Change Summary
December 2014	2.9	Introduction	Updated the Features section. Revised Table 1-1, MachXO2 Family Selection Guide. — Removed XO2-4000U data. — Removed 400-ball ftBGA. — Removed 25-ball WLCSP value for XO2-2000U.
		DC and Switching Characteristics	Updated the Recommended Operating Conditions section. Adjusted Max. values for V_{CC} and V_{CCIO} . Updated the sysIO Recommended Operating Conditions section. Adjusted Max. values for LVCMOS 3.3, LVTTTL, PCI, LVDS33 and LVPECL.
		Pinout Information	Updated the Pinout Information Summary section. Removed MachXO2-4000U.
		Ordering Information	Updated the MachXO2 Part Number Description section. Removed BG400 package.
			Updated the High-Performance Commercial Grade Devices with Voltage Regulator, Halogen Free (RoHS) Packaging section. Removed LCMXO2-4000UHC part numbers. Updated the High-Performance Industrial Grade Devices with Voltage Regulator, Halogen Free (RoHS) Packaging section. Removed LCMXO2-4000UHC part numbers.
November 2014	2.8	Introduction	Updated the Features section. — Revised I/Os under Flexible Logic Architecture. — Revised standby power under Ultra Low Power Devices. — Revise input frequency range under Flexible On-Chip Clocking. Updated Table 1-1, MachXO2 Family Selection Guide. — Added XO2-4000U data. — Removed HE and ZE device options for XO2-4000. — Added 400-ball ftBGA.
			Updated the Pinout Information Summary section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400.
		Ordering Information	Updated the MachXO2 Part Number Description section. Added BG400 package.
			Updated the Ordering Information section. Added MachXO2-4000U caBGA400 and MachXO2-7000 caBGA400 part numbers.
		Architecture	Updated the Supported Standards section. Added MIPI information to Table 2-12. Supported Input Standards and Table 2-13. Supported Output Standards.
October 2014	2.7	Ordering Information	Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Fixed typo in LCMXO2-2000ZE-1UWG49ITR part number package.
		DC and Switching Characteristics	Updated the BLVDS section. Changed output impedance nominal values in Table 3-2, BLVDS DC Condition. Updated the LVPECL section. Changed output impedance nominal value in Table 3-3, LVPECL DC Condition. Updated the sysCONFIG Port Timing Specifications section. Updated INITN low time values.
		Architecture	Updated the Supported Standards section. Added MIPI information to Table 2-12. Supported Input Standards and Table 2-13. Supported Output Standards.
July 2014	2.6	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics ^{1,2} section. Updated footnote 4. Updated Register-to-Register Performance section. Updated footnote.
			Updated UW49 package to UWG49 in MachXO2 Part Number Description.
		Ordering Information	Updated LCMXO2-2000ZE-1UWG49CTR package in Ultra Low Power Commercial Grade Devices, Halogen Free (RoHS) Packaging.

Date	Version	Section	Change Summary
May 2011	01.3	Multiple	Replaced “SED” with “SRAM CRC Error Detection” throughout the document.
		DC and Switching Characteristics	Added footnote 1 to Program Erase Specifications table.
		Pinout Information	Updated Pin Information Summary tables.
			Signal name SO/SISPISO changed to SO/SPISO in the Signal Descriptions table.
April 2011	01.2	—	Data sheet status changed from Advance to Preliminary.
		Introduction	Updated MachXO2 Family Selection Guide table.
		Architecture	Updated Supported Input Standards table.
			Updated sysMEM Memory Primitives diagram.
			Added differential SSTL and HSTL IO standards.
		DC and Switching Characteristics	Updates following parameters: POR voltage levels, DC electrical characteristics, static supply current for ZE/HE/HC devices, static power consumption contribution of different components – ZE devices, programming and erase Flash supply current.
			Added VREF specifications to sysIO recommended operating conditions.
			Updating timing information based on characterization.
			Added differential SSTL and HSTL IO standards.
		Ordering Information	Added Ordering Part Numbers for R1 devices, and devices in WLCSP packages.
			Added R1 device specifications.
January 2011	01.1	All	Included ultra-high I/O devices.
		DC and Switching Characteristics	Recommended Operating Conditions table – Added footnote 3.
			DC Electrical Characteristics table – Updated data for I_{IL} , I_{IH} , V_{HYST} typical values updated.
			Generic DDRX2 Outputs with Clock and Data Aligned at Pin (GDDR2_TX.ECLK.Aligned) Using PCLK Pin for Clock Input tables – Updated data for T_{DIA} and T_{DIB} .
			Generic DDRX4 Outputs with Clock and Data Aligned at Pin (GDDR4_TX.ECLK.Aligned) Using PCLK Pin for Clock Input tables – Updated data for T_{DIA} and T_{DIB} .
			Power-On-Reset Voltage Levels table - clarified note 3.
			Clarified VCCIO related recommended operating conditions specifications.
			Added power supply ramp rate requirements.
			Added Power Supply Ramp Rates table.
			Updated Programming/Erase Specifications table.
			Removed references to V_{CCP} .
		Pinout Information	Included number of 7:1 and 8:1 gearboxes (input and output) in the pin information summary tables.
			Removed references to V_{CCP} .
November 2010	01.0	—	Initial release.
