Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	206
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LFBGA
Supplier Device Package	256-CABGA (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-7000he-5bg256c

Table 2-4. PLL Signal Descriptions (Continued)

Port Name	I/O	Description
CLKOP	O	Primary PLL output clock (with phase shift adjustment)
CLKOS	O	Secondary PLL output clock (with phase shift adjust)
CLKOS2	O	Secondary PLL output clock2 (with phase shift adjust)
CLKOS3	O	Secondary PLL output clock3 (with phase shift adjust)
LOCK	O	PLL LOCK, asynchronous signal. Active high indicates PLL is locked to input and feedback signals.
DPHSRC	O	Dynamic Phase source – ports or WISHBONE is active
STDBY	I	Standby signal to power down the PLL
RST	I	PLL reset without resetting the M-divider. Active high reset.
RESETM	I	PLL reset - includes resetting the M-divider. Active high reset.
RESETC	I	Reset for CLKOS2 output divider only. Active high reset.
RESETD	I	Reset for CLKOS3 output divider only. Active high reset.
ENCLKOP	I	Enable PLL output CLKOP
ENCLKOS	I	Enable PLL output CLKOS when port is active
ENCLKOS2	I	Enable PLL output CLKOS2 when port is active
ENCLKOS3	I	Enable PLL output CLKOS3 when port is active
PLLCLK	I	PLL data bus clock input signal
PLLIRST	I	PLL data bus reset. This resets only the data bus not any register values.
PLLSTB	I	PLL data bus strobe signal
PLLWE	I	PLL data bus write enable signal
PLLADDR [4:0]	I	PLL data bus address
PLLDATI [7:0]	I	PLL data bus data input
PLLDATO [7:0]	O	PLL data bus data output
PLLACK	O	PLL data bus acknowledge signal

sysMEM Embedded Block RAM Memory

The MachXO2-640/U and larger devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-kbit RAM, with dedicated input and output registers. This memory can be used for a wide variety of purposes including data buffering, PROM for the soft processor and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-5.

DDR Memory Support

Certain PICs on the right edge of MachXO2-640U, MachXO2-1200/U and larger devices, have additional circuitry to allow the implementation of DDR memory interfaces. There are two groups of 14 or 12 PIOs each on the right edge with additional circuitry to implement DDR memory interfaces. This capability allows the implementation of up to 16-bit wide memory interfaces. One PIO from each group contains a control element, the DQS Read/Write Block, to facilitate the generation of clock and control signals (DQSR90, DQSW90, DDRCLKPOL and DATAVALID). These clock and control signals are distributed to the other PIO in the group through dedicated low skew routing.

DQS Read Write Block

Source synchronous interfaces generally require the input clock to be adjusted in order to correctly capture data at the input register. For most interfaces a PLL is used for this adjustment. However, in DDR memories the clock (referred to as DQS) is not free-running so this approach cannot be used. The DQS Read Write block provides the required clock alignment for DDR memory interfaces. DQSR90 and DQSW90 signals are generated by the DQS Read Write block from the DQS input.

In a typical DDR memory interface design, the phase relationship between the incoming delayed DQS strobe and the internal system clock (during the read cycle) is unknown. The MachXO2 family contains dedicated circuits to transfer data between these domains. To prevent set-up and hold violations, at the domain transfer between DQS (delayed) and the system clock, a clock polarity selector is used. This circuit changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of each read cycle for the correct clock polarity. Prior to the read operation in DDR memories, DQS is in tri-state (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit in the DQS Read Write block detects the first DQS rising edge after the preamble state and generates the DDRCLKPOL signal. This signal is used to control the polarity of the clock to the synchronizing registers.

The temperature, voltage and process variations of the DQS delay block are compensated by a set of calibration signals (6-bit bus) from a DLL on the right edge of the device. The DLL loop is compensated for temperature, voltage and process variations by the system clock and feedback loop.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems including LVCMOS, TTL, PCI, SSTL, HSTL, LVDS, BLVDS, MLVDS and LVPECL.

Each bank is capable of supporting multiple I/O standards. In the MachXO2 devices, single-ended output buffers, ratioed input buffers (LVTTL, LVCMOS and PCI), differential (LVDS) and referenced input buffers (SSTL and HSTL) are powered using I/O supply voltage (V_{CCIO}). Each sysIO bank has its own V_{CCIO} . In addition, each bank has a voltage reference, V_{REF} which allows the use of referenced input buffers independent of the bank V_{CCIO} .

MachXO2-256 and MachXO2-640 devices contain single-ended ratioed input buffers and single-ended output buffers with complementary outputs on all the I/O banks. Note that the single-ended input buffers on these devices do not contain PCI clamps. In addition to the single-ended I/O buffers these two devices also have differential and referenced input buffers on all I/Os. The I/Os are arranged in pairs, the two pads in the pair are described as "T" and "C", where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

MachXO2-640U, MachXO2-1200/U, MachXO2-2000/U, MachXO2-4000 and MachXO2-7000 devices contain three types of sysIO buffer pairs.

1. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the left and right of the devices also have differential and referenced input buffers.

2. Bottom sysIO Buffer Pairs

The sysIO buffer pairs in the bottom bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the bottom also have differential and referenced input buffers. Only the I/Os on the bottom banks have programmable PCI clamps and differential input termination. The PCI clamp is enabled after V_{CC} and V_{CCIO} are at valid operating levels and the device has been configured.

3. Top sysIO Buffer Pairs

The sysIO buffer pairs in the top bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the top also have differential and referenced I/O buffers. Half of the sysIO buffer pairs on the top edge have true differential outputs. The sysIO buffer pair comprising of the A and B PIOs in every PIC on the top edge have a differential output driver. The referenced input buffer can also be configured as a differential input buffer.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCIO0} have reached V_{PORUP} level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-down to GND (some pins such as PROGRAMN and the JTAG pins have weak pull-up to V_{CCIO} as the default functionality). The I/O pins will maintain the blank configuration until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached V_{PORUP} levels at which time the I/Os will take on the user-configured settings only after a proper download/configuration.

Supported Standards

The MachXO2 sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS, LVTTL, and PCI. The buffer supports the LVTTL, PCI, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3 V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS, MLVDS and LVPECL output emulation is supported on all devices. The MachXO2-640U, MachXO2-1200/U and higher devices support on-chip LVDS output buffers on approximately 50% of the I/Os on the top bank. Differential receivers for LVDS, BLVDS, MLVDS and LVPECL are supported on all banks of MachXO2 devices. PCI support is provided in the bottom bank of the MachXO2-640U, MachXO2-1200/U and higher density devices. Table 2-11 summarizes the I/O characteristics of the MachXO2 PLDs.

Tables 2-11 and 2-12 show the I/O standards (together with their supply and reference voltages) supported by the MachXO2 devices. For further information on utilizing the sysIO buffer to support a variety of standards please see TN1202, [MachXO2 sysIO Usage Guide](#).

Figure 2-20. Embedded Function Block Interface

Hardened I²C IP Core

Every MachXO2 device contains two I²C IP cores. These are the primary and secondary I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I²C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Up to 400 kHz data transfer speed
- General call support
- Interface to custom logic through 8-bit WISHBONE interface

Static Supply Current – ZE Devices^{1, 2, 3, 6}

Symbol	Parameter	Device	Typ. ⁴	Units
I_{CC}	Core Power Supply	LCMXO2-256ZE	18	μA
		LCMXO2-640ZE	28	μA
		LCMXO2-1200ZE	56	μA
		LCMXO2-2000ZE	80	μA
		LCMXO2-4000ZE	124	μA
		LCMXO2-7000ZE	189	μA
I_{CCIO}	Bank Power Supply ⁵ $V_{CCIO} = 2.5 V$	All devices	1	μA

1. For further information on supply current, please refer to TN1198, [Power Estimation and Management for MachXO2 Devices](#).
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off. To estimate the impact of turning each of these items on, please refer to the following table or for more detail with your specific design use the Power Calculator tool.
3. Frequency = 0 MHz.
4. $T_J = 25^\circ C$, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO2 peak start-up current data, use the Power Calculator tool.

Static Power Consumption Contribution of Different Components – ZE Devices

The table below can be used for approximating static power consumption. For a more accurate power analysis for your design please use the Power Calculator tool.

Symbol	Parameter	Typ.	Units
I_{DCBG}	Bandgap DC power contribution	101	μA
I_{DCPOR}	POR DC power contribution	38	μA
$I_{DCIOBANKCONTROLLER}$	DC power contribution per I/O bank controller	143	μA

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.

2. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.

3. Input on the bottom bank of the MachXO2-640U, MachXO2-1200/U and larger devices only.

4. Supported only for inputs and BIDs for all ZE devices, and –6 speed grade for HE and HC devices.

LVPECL

The MachXO2 family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Differential LVPECL is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL

- Exact performance may vary with device and design implementation. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.
- General I/O timing numbers based on LVCMOS 2.5, 8 mA, 0 pF load, fast slew rate.
- Generic DDR timing numbers based on LVDS I/O (for input, output, and clock ports).
- DDR timing numbers based on SSTL25. DDR2 timing numbers based on SSTL18. LPDDR timing numbers based in LVCMOS18.
- 7:1 LVDS (GDDR71) uses the LVDS I/O standard (for input, output, and clock ports).
- For Generic DDRX1 mode $t_{SU} = t_{HO} = (t_{DVE} - t_{DVA} - 0.03 \text{ ns})/2$.
- The t_{SU_DEL} and t_{H_DEL} values use the SCLK_ZERHOLD default step size. Each step is 167 ps (–3), 182 ps (–2), 195 ps (–1).
- This number for general purpose usage. Duty cycle tolerance is +/-10%.
- Duty cycle is +/- 5% for system usage.
- The above timing numbers are generated using the Diamond design tool. Exact performance may vary with the device selected.
- High-speed DDR and LVDS not supported in SG32 (32-Pin QFN) packages.
- Advance information for MachXO2 devices in 48 QFN packages.
- DDR memory interface not supported in QN84 (84 QFN) and SG32 (32 QFN) packages.

Flash Download Time^{1, 2}

Symbol	Parameter	Device	Typ.	Units
t_{REFRESH}	POR to Device I/O Active	LCMXO2-256	0.6	ms
		LCMXO2-640	1.0	ms
		LCMXO2-640U	1.9	ms
		LCMXO2-1200	1.9	ms
		LCMXO2-1200U	1.4	ms
		LCMXO2-2000	1.4	ms
		LCMXO2-2000U	2.4	ms
		LCMXO2-4000	2.4	ms
		LCMXO2-7000	3.8	ms

1. Assumes sysMEM EBR initialized to an all zero pattern if they are used.

2. The Flash download time is measured starting from the maximum voltage of POR trip point.

JTAG Port Timing Specifications

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	TCK clock frequency	—	25	MHz
t_{BTCPH}	TCK [BSCAN] clock pulse width high	20	—	ns
t_{BTCPL}	TCK [BSCAN] clock pulse width low	20	—	ns
t_{BTS}	TCK [BSCAN] setup time	10	—	ns
t_{BTH}	TCK [BSCAN] hold time	8	—	ns
t_{BTCO}	TAP controller falling edge of clock to valid output	—	10	ns
t_{BTCODIS}	TAP controller falling edge of clock to valid disable	—	10	ns
t_{BTCOEN}	TAP controller falling edge of clock to valid enable	—	10	ns
t_{BTCRS}	BSCAN test capture register setup time	8	—	ns
t_{BTCRH}	BSCAN test capture register hold time	20	—	ns
t_{BUTCO}	BSCAN test update register, falling edge of clock to valid output	—	25	ns
t_{BTUODIS}	BSCAN test update register, falling edge of clock to valid disable	—	25	ns
t_{BTUPOEN}	BSCAN test update register, falling edge of clock to valid enable	—	25	ns

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
INITN	I/O	Open Drain pin. Indicates the FPGA is ready to be configured. During configuration, or when reserved as INITn in user mode, this pin has an active pull-up.
DONE	I/O	Open Drain pin. Indicates that the configuration sequence is complete, and the start-up sequence is in progress. During configuration, or when reserved as DONE in user mode, this pin has an active pull-up.
MCLK/CCLK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA in SPI and SPIm configuration modes.
SN	I	Slave SPI active low chip select input.
CSSPIN	I/O	Master SPI active low chip select output.
SI/SPISI	I/O	Slave SPI serial data input and master SPI serial data output.
SO/SPISO	I/O	Slave SPI serial data output and master SPI serial data input.
SCL	I/O	Slave I ² C clock input and master I ² C clock output.
SDA	I/O	Slave I ² C data input and master I ² C data output.

1. Lattice recommends soldering the central thermal pad onto the top PCB ground for improved thermal resistance.
2. For 48 QFN package, exposed die pad is the device ground.
3. 48-pin QFN information is 'Advanced'.

LCMXO2-2000HC-6MG132I	2112	2.5 V / 3.3 V	–6	Halogen-Free csBGA	132	IND
LCMXO2-2000HC-4TG144I	2112	2.5 V / 3.3 V	–4	Halogen-Free TQFP	144	IND
LCMXO2-2000HC-5TG144I	2112	2.5 V / 3.3 V	–5	Halogen-Free TQFP	144	IND
LCMXO2-2000HC-6TG144I	2112	2.5 V / 3.3 V	–6	Halogen-Free TQFP	144	IND
LCMXO2-2000HC-4BG256I	2112	2.5 V / 3.3 V	–4	Halogen-Free caBGA	256	IND
LCMXO2-2000HC-5BG256I	2112	2.5 V / 3.3 V	–5	Halogen-Free caBGA	256	IND
LCMXO2-2000HC-6BG256I	2112	2.5 V / 3.3 V	–6	Halogen-Free caBGA	256	IND
LCMXO2-2000HC-4FTG256I	2112	2.5 V / 3.3 V	–4	Halogen-Free ftBGA	256	IND
LCMXO2-2000HC-5FTG256I	2112	2.5 V / 3.3 V	–5	Halogen-Free ftBGA	256	IND
LCMXO2-2000HC-6FTG256I	2112	2.5 V / 3.3 V	–6	Halogen-Free ftBGA	256	IND

Part Number	LUTs	Supply Voltage	Grade	Package	Leads	Temp.
LCMXO2-2000UHC-4FG484I	2112	2.5 V / 3.3 V	–4	Halogen-Free fpBGA	484	IND
LCMXO2-2000UHC-5FG484I	2112	2.5 V / 3.3 V	–5	Halogen-Free fpBGA	484	IND
LCMXO2-2000UHC-6FG484I	2112	2.5 V / 3.3 V	–6	Halogen-Free fpBGA	484	IND

High Performance Industrial Grade Devices Without Voltage Regulator, Halogen Free (RoHS) Packaging

Part Number	LUTs	Supply Voltage	Grade	Package	Leads	Temp.
LCMXO2-2000HE-4TG100I	2112	1.2 V	–4	Halogen-Free TQFP	100	IND
LCMXO2-2000HE-5TG100I	2112	1.2 V	–5	Halogen-Free TQFP	100	IND
LCMXO2-2000HE-6TG100I	2112	1.2 V	–6	Halogen-Free TQFP	100	IND
LCMXO2-2000HE-4MG132I	2112	1.2 V	–4	Halogen-Free csBGA	132	IND
LCMXO2-2000HE-5MG132I	2112	1.2 V	–5	Halogen-Free csBGA	132	IND
LCMXO2-2000HE-6MG132I	2112	1.2 V	–6	Halogen-Free csBGA	132	IND
LCMXO2-2000HE-4TG144I	2112	1.2 V	–4	Halogen-Free TQFP	144	IND
LCMXO2-2000HE-5TG144I	2112	1.2 V	–5	Halogen-Free TQFP	144	IND
LCMXO2-2000HE-6TG144I	2112	1.2 V	–6	Halogen-Free TQFP	144	IND
LCMXO2-2000HE-4BG256I	2112	1.2 V	–4	Halogen-Free caBGA	256	IND
