Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	278
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	332-FBGA
Supplier Device Package	332-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmx02-7000he-6bg332c

Introduction

The MachXO2 family of ultra low power, instant-on, non-volatile PLDs has six devices with densities ranging from 256 to 6864 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic these devices feature Embedded Block RAM (EBR), Distributed RAM, User Flash Memory (UFM), Phase Locked Loops (PLLs), pre-engineered source synchronous I/O support, advanced configuration support including dual-boot capability and hardened versions of commonly used functions such as SPI controller, I²C controller and timer/counter. These features allow these devices to be used in low cost, high volume consumer and system applications.

The MachXO2 devices are designed on a 65 nm non-volatile low power process. The device architecture has several features such as programmable low swing differential I/Os and the ability to turn off I/O banks, on-chip PLLs and oscillators dynamically. These features help manage static and dynamic power consumption resulting in low static power for all members of the family.

The MachXO2 devices are available in two versions – ultra low power (ZE) and high performance (HC and HE) devices. The ultra low power devices are offered in three speed grades –1, –2 and –3, with –3 being the fastest. Similarly, the high-performance devices are offered in three speed grades: –4, –5 and –6, with –6 being the fastest. HC devices have an internal linear voltage regulator which supports external V_{CC} supply voltages of 3.3 V or 2.5 V. ZE and HE devices only accept 1.2 V as the external V_{CC} supply voltage. With the exception of power supply voltage all three types of devices (ZE, HC and HE) are functionally compatible and pin compatible with each other.

The MachXO2 PLDs are available in a broad range of advanced halogen-free packages ranging from the space saving 2.5 mm x 2.5 mm WLCSP to the 23 mm x 23 mm fpBGA. MachXO2 devices support density migration within the same package. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The pre-engineered source synchronous logic implemented in the MachXO2 device family supports a broad range of interface standards, including LPDDR, DDR, DDR2 and 7:1 gearing for display I/Os.

The MachXO2 devices offer enhanced I/O features such as drive strength control, slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a “per-pin” basis.

A user-programmable internal oscillator is included in MachXO2 devices. The clock output from this oscillator may be divided by the timer/counter for use as clock input in functions such as LED control, key-board scanner and similar state machines.

The MachXO2 devices also provide flexible, reliable and secure configuration from on-chip Flash memory. These devices can also configure themselves from external SPI Flash or be configured by an external master through the JTAG test access port or through the I²C port. Additionally, MachXO2 devices support dual-boot capability (using external Flash memory) and remote field upgrade (TransFR) capability.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the MachXO2 family of devices. Popular logic synthesis tools provide synthesis library support for MachXO2. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the MachXO2 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) LatticeCORE™ modules, including a number of reference designs licensed free of charge, optimized for the MachXO2 PLD family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the t_{LOCK} parameter has been satisfied.

The MachXO2 also has a feature that allows the user to select between two different reference clock sources dynamically. This feature is implemented using the PLLREFCS primitive. The timing parameters for the PLL are shown in the [sysCLOCK PLL Timing](#) table.

The MachXO2 PLL contains a WISHBONE port feature that allows the PLL settings, including divider values, to be dynamically changed from the user logic. When using this feature the EFB block must also be instantiated in the design to allow access to the WISHBONE ports. Similar to the dynamic phase adjustment, when PLL settings are updated through the WISHBONE port the PLL may lose lock and not relock until the t_{LOCK} parameter has been satisfied. The timing parameters for the PLL are shown in the [sysCLOCK PLL Timing](#) table.

For more details on the PLL and the WISHBONE interface, see TN1199, [MachXO2 sysCLOCK PLL Design and Usage Guide](#).

Figure 2-7. PLL Diagram

Table 2-4 provides signal descriptions of the PLL block.

Table 2-4. PLL Signal Descriptions

Port Name	I/O	Description
CLKI	I	Input clock to PLL
CLKFB	I	Feedback clock
PHASESEL[1:0]	I	Select which output is affected by Dynamic Phase adjustment ports
PHASEDIR	I	Dynamic Phase adjustment direction
PHASESTEP	I	Dynamic Phase step – toggle shifts VCO phase adjust by one step.

Figure 2-8. sysMEM Memory Primitives

Table 2-6. EBR Signal Descriptions

Port Name	Description	Active State
CLK	Clock	Rising Clock Edge
CE	Clock Enable	Active High
OCE ¹	Output Clock Enable	Active High
RST	Reset	Active High
BE ¹	Byte Enable	Active High
WE	Write Enable	Active High
AD	Address Bus	—
DI	Data In	—
DO	Data Out	—
CS	Chip Select	Active High
AFF	FIFO RAM Almost Full Flag	—
FF	FIFO RAM Full Flag	—
AEF	FIFO RAM Almost Empty Flag	—
EF	FIFO RAM Empty Flag	—
RPRST	FIFO RAM Read Pointer Reset	—

1. Optional signals.

2. For dual port EBR primitives a trailing 'A' or 'B' in the signal name specifies the EBR port A or port B respectively.

3. For FIFO RAM mode primitive, a trailing 'R' or 'W' in the signal name specifies the FIFO read port or write port respectively.

4. For FIFO RAM mode primitive FULLI has the same function as CSW(2) and EMPTYI has the same function as CSR(2).

5. In FIFO mode, CLKW is the write port clock, CSW is the write port chip select, CLKR is the read port clock, CSR is the read port chip select, ORE is the output read enable.

Figure 2-11. Group of Four Programmable I/O Cells

Notes:

1. Input gearbox is available only in PIC on the bottom edge of MachXO2-640U, MachXO2-1200/U and larger devices.
2. Output gearbox is available only in PIC on the top edge of MachXO2-640U, MachXO2-1200/U and larger devices.

Output Register Block

The output register block registers signals from the core of the device before they are passed to the sysIO buffers.

Left, Top, Bottom Edges

In SDR mode, D0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type register or latch.

In DDR generic mode, D0 and D1 inputs are fed into registers on the positive edge of the clock. At the next falling edge the registered D1 input is registered into the register Q1. A multiplexer running off the same clock is used to switch the mux between the outputs of registers Q0 and Q1 that will then feed the output.

Figure 2-14 shows the output register block on the left, top and bottom edges.

Figure 2-14. MachXO2 Output Register Block Diagram (PIO on the Left, Top and Bottom Edges)

Right Edge

The output register block on the right edge is a superset of the output register on left, top and bottom edges of the device. In addition to supporting SDR and Generic DDR modes, the output register blocks for PIOs on the right edge include additional logic to support DDR-memory interfaces. Operation of this block is similar to that of the output register block on other edges.

In DDR memory mode, D0 and D1 inputs are fed into registers on the positive edge of the clock. At the next falling edge the registered D1 input is registered into the register Q1. A multiplexer running off the DQSW90 signal is used to switch the mux between the outputs of registers Q0 and Q1 that will then feed the output.

Figure 2-15 shows the output register block on the right edge.

These gearboxes have three stage pipeline registers. The first stage registers sample the high-speed input data by the high-speed edge clock on its rising and falling edges. The second stage registers perform data alignment based on the control signals UPDATE and SEL0 from the control block. The third stage pipeline registers pass the data to the device core synchronized to the low-speed system clock. Figure 2-16 shows a block diagram of the input gearbox.

Figure 2-16. Input Gearbox

More information on the input gearbox is available in TN1203, [Implementing High-Speed Interfaces with MachXO2 Devices](#).

Output Gearbox

Each PIC on the top edge has a built-in 8:1 output gearbox. Each of these output gearboxes may be programmed as a 7:1 serializer or as one ODDR4 (8:1) gearbox or as two ODDR2 (4:1) gearboxes. Table 2-10 shows the gearbox signals.

Table 2-10. Output Gearbox Signal List

Name	I/O Type	Description
Q	Output	High-speed data output
D[7:0]	Input	Low-speed data from device core
Video TX(7:1): D[6:0]		
GDDR4(8:1): D[7:0]		
GDDR2(4:1)(IOL-A): D[3:0]		
GDDR2(4:1)(IOL-C): D[7:4]		
SCLK	Input	Slow-speed system clock
ECLK [1:0]	Input	High-speed edge clock
RST	Input	Reset

The gearboxes have three stage pipeline registers. The first stage registers sample the low-speed input data on the low-speed system clock. The second stage registers transfer data from the low-speed clock registers to the high-speed clock registers. The third stage pipeline registers controlled by high-speed edge clock shift and mux the high-speed data out to the sysIO buffer. Figure 2-17 shows the output gearbox block diagram.

C1	I/O Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	3	5	9	pF
C2	Dedicated Input Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	3	5.5	7	pF
V_{HYST}	Hysteresis for Schmitt Trigger Inputs ⁵	$V_{CCIO} = 3.3 V, \text{Hysteresis} = \text{Large}$	—	450	—	mV
		$V_{CCIO} = 2.5 V, \text{Hysteresis} = \text{Large}$	—	250	—	mV
		$V_{CCIO} = 1.8 V, \text{Hysteresis} = \text{Large}$	—	125	—	mV
		$V_{CCIO} = 1.5 V, \text{Hysteresis} = \text{Large}$	—	100	—	mV
		$V_{CCIO} = 3.3 V, \text{Hysteresis} = \text{Small}$	—	250	—	mV
		$V_{CCIO} = 2.5 V, \text{Hysteresis} = \text{Small}$	—	150	—	mV
		$V_{CCIO} = 1.8 V, \text{Hysteresis} = \text{Small}$	—	60	—	mV
		$V_{CCIO} = 1.5 V, \text{Hysteresis} = \text{Small}$	—	40	—	mV

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. $T_A = 25^\circ C, f = 1.0 \text{ MHz}$.
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. When V_{IH} is higher than V_{CCIO} , a transient current typically of 30 ns in duration or less with a peak current of 6 mA can occur on the high-to-low transition. For true LVDS output pins in MachXO2-640U, MachXO2-1200/U and larger devices, V_{IH} must be less than or equal to V_{CCIO} .
5. With bus keeper circuit turned on. For more details, refer to TN1202, [MachXO2 sysIO Usage Guide](#).

LVDS Emulation

MachXO2 devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Figure 3-1. LVDS Using External Resistors (LVDS25E)

Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typ.	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	158	Ohms
R_P	Driver parallel resistor	140	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	6.03	mA

RSDS

The MachXO2 family supports the differential RSDS standard. The output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

Figure 3-4. RSDS (Reduced Swing Differential Standard)

Table 3-4. RSDS DC Conditions

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	294	Ohms

Date	Version	Section	Change Summary
January 2013	02.0	Introduction	Updated the total number IOs to include JTAGENB.
		Architecture	Supported Output Standards table – Added 3.3 V _{CCIO} (Typ.) to LVDS row.
			Changed SRAM CRC Error Detection to Soft Error Detection.
		DC and Switching Characteristics	Power Supply Ramp Rates table – Updated Units column for t _{RAMP} symbol.
			Added new Maximum sysIO Buffer Performance table.
			sysCLOCK PLL Timing table – Updated Min. column values for f _{IN} , f _{OUT} , f _{OUT2} and f _{PFD} parameters. Added t _{SPO} parameter. Updated footnote 6.
			MachXO2 Oscillator Output Frequency table – Updated symbol name for t _{STABLEOSC} .
			DC Electrical Characteristics table – Updated conditions for I _{IL} , I _{IH} symbols.
			Corrected parameters tDQVBS and tDQVAS
			Corrected MachXO2 ZE parameters tDVADQ and tDVEDQ
		Pinout Information	Included the MachXO2-4000HE 184 csBGA package.
		Ordering Information	Updated part number.
April 2012	01.9	Architecture	Removed references to TN1200.
		Ordering Information	Updated the Device Status portion of the MachXO2 Part Number Description to include the 50 parts per reel for the WLCSP package.
			Added new part number and footnote 2 for LCMXO2-1200ZE-1UWG25ITR50.
			Updated footnote 1 for LCMXO2-1200ZE-1UWG25ITR.
		Supplemental Information	Removed references to TN1200.
March 2012	01.8	Introduction	Added 32 QFN packaging information to Features bullets and MachXO2 Family Selection Guide table.
		DC and Switching Characteristics	Changed 'STANDBY' to 'USERSTDBY' in Standby Mode timing diagram.
		Pinout Information	Removed footnote from Pin Information Summary tables.
			Added 32 QFN package to Pin Information Summary table.
		Ordering Information	Updated Part Number Description and Ordering Information tables for 32 QFN package.
			Updated topside mark diagram in the Ordering Information section.
