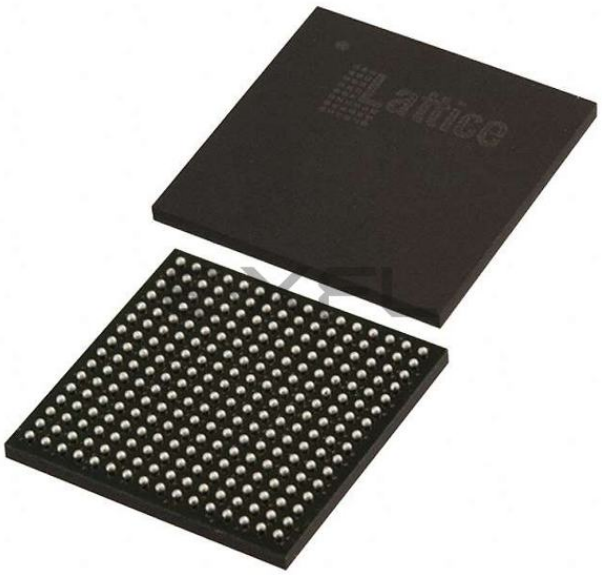
Lattice Semiconductor Corporation - LCMXO2-7000ZE-1FTG256C Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	206
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-7000ze-1ftg256c

MachXO2 Family Data Sheet Introduction

May 2016 Data Sheet DS1035

Features

- **Flexible Logic Architecture**
  - Six devices with 256 to 6864 LUT4s and 18 to 334 I/Os
- **Ultra Low Power Devices**
  - Advanced 65 nm low power process
  - As low as 22 µW standby power
  - Programmable low swing differential I/Os
  - Stand-by mode and other power saving options
- **Embedded and Distributed Memory**
  - Up to 240 kbits sysMEM™ Embedded Block RAM
  - Up to 54 kbits Distributed RAM
  - Dedicated FIFO control logic
- **On-Chip User Flash Memory**
  - Up to 256 kbits of User Flash Memory
  - 100,000 write cycles
  - Accessible through WISHBONE, SPI, I^2C and JTAG interfaces
  - Can be used as soft processor PROM or as Flash memory
- **Pre-Engineered Source Synchronous I/O**
  - DDR registers in I/O cells
  - Dedicated gearing logic
  - 7:1 Gearing for Display I/Os
  - Generic DDR, DDRX2, DDRX4
  - Dedicated DDR/DDR2/LPDDR memory with DQS support
- **High Performance, Flexible I/O Buffer**
  - Programmable sysIO™ buffer supports wide range of interfaces:
    - LVCMOS 3.3/2.5/1.8/1.5/1.2
    - LVTTL
    - PCI
    - LVDS, Bus-LVDS, MLVDS, RSDS, LVPECL
    - SSTL 25/18
    - HSTL 18
    - Schmitt trigger inputs, up to 0.5 V hysteresis
  - I/Os support hot socketing
  - On-chip differential termination
  - Programmable pull-up or pull-down mode
- **Flexible On-Chip Clocking**
  - Eight primary clocks
  - Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
  - Up to two analog PLLs per device with fractional-n frequency synthesis
    - Wide input frequency range (7 MHz to 400 MHz)
- **Non-volatile, Infinitely Reconfigurable**
  - Instant-on – powers up in microseconds
  - Single-chip, secure solution
  - Programmable through JTAG, SPI or I^2C
  - Supports background programming of non-volatile memory
  - Optional dual boot with external SPI memory
- **TransFR™ Reconfiguration**
  - In-field logic update while system operates
- **Enhanced System Level Support**
  - On-chip hardened functions: SPI, I^2C, timer/counter
  - On-chip oscillator with 5.5% accuracy
  - Unique TraceID for system tracking
  - One Time Programmable (OTP) mode
  - Single power supply with extended operating range
  - IEEE Standard 1149.1 boundary scan
  - IEEE 1532 compliant in-system programming
- **Broad Range of Package Options**
  - TQFP, WLCSP, ucBGA, csBGA, caBGA, ftBGA, fpBGA, QFN package options
  - Small footprint package options
    - As small as 2.5 mm x 2.5 mm
  - Density migration supported
  - Advanced halogen-free packaging

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Routing

There are many resources provided in the MachXO2 devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO2 device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

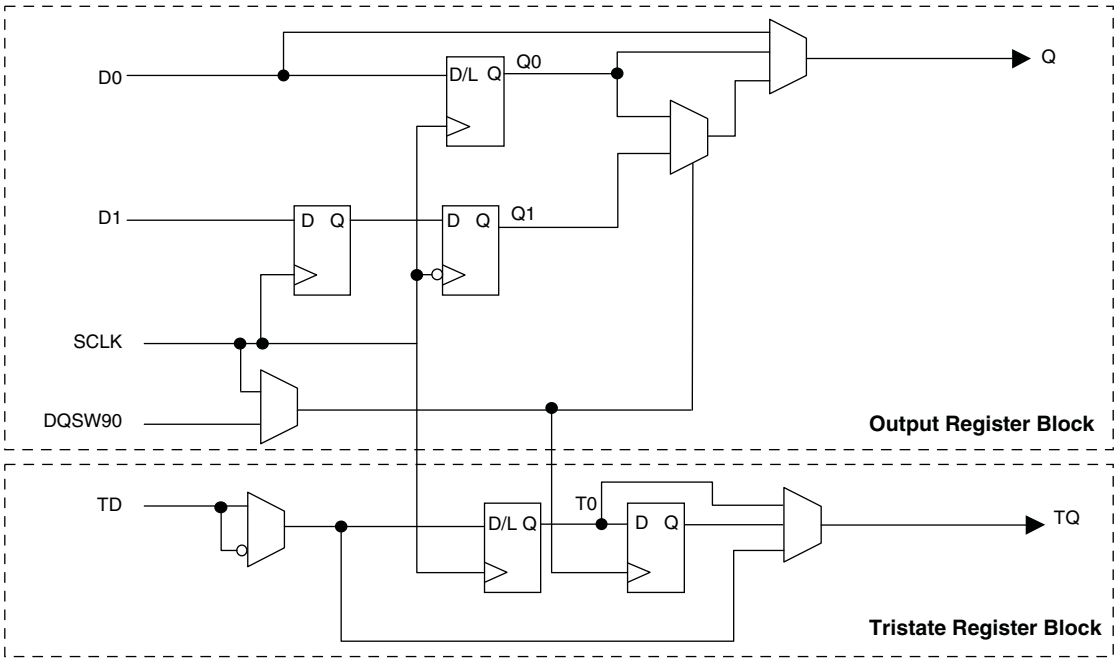
The MachXO2 architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO2-640U, MachXO2-1200/U and higher density devices have two edge clocks each on the top and bottom edges. Lower density devices have no edge clocks. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO2 devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO2 External Switching Characteristics table.

The primary clock signals for the MachXO2-256 and MachXO2-640 are generated from eight 17:1 muxes The available clock sources include eight I/O sources and 9 routing inputs. Primary clock signals for the MachXO2-640U, MachXO2-1200/U and larger devices are generated from eight 27:1 muxes The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sysCLOCK PLL outputs.

Figure 2-15. MachXO2 Output Register Block Diagram (PIO on the Right Edges)



Tri-state Register Block

The tri-state register block registers tri-state control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation. In SDR, TD input feeds one of the flip-flops that then feeds the output.

The tri-state register blocks on the right edge contain an additional register for DDR memory operation. In DDR memory mode, the register TS input is fed into another register that is clocked using the DQSW90 signal. The output of this register is used as a tri-state control.

Input Gearbox

Each PIC on the bottom edge has a built-in 1:8 input gearbox. Each of these input gearboxes may be programmed as a 1:7 de-serializer or as one IDDRX4 (1:8) gearbox or as two IDDRX2 (1:4) gearboxes. Table 2-9 shows the gearbox signals.

Table 2-9. Input Gearbox Signal List

Name	I/O Type	Description
D	Input	High-speed data input after programmable delay in PIO A input register block
ALIGNWD	Input	Data alignment signal from device core
SCLK	Input	Slow-speed system clock
ECLK[1:0]	Input	High-speed edge clock
RST	Input	Reset
Q[7:0]	Output	Low-speed data to device core: Video RX(1:7): Q[6:0] GDDRX4(1:8): Q[7:0] GDDRX2(1:4)(IOL-A): Q4, Q5, Q6, Q7 GDDRX2(1:4)(IOL-C): Q0, Q1, Q2, Q3

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, Minimizing System Interruption During Configuration Using TransFR Technology (Appendix B)
- TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices

Figure 2-22. SPI Core Block Diagram

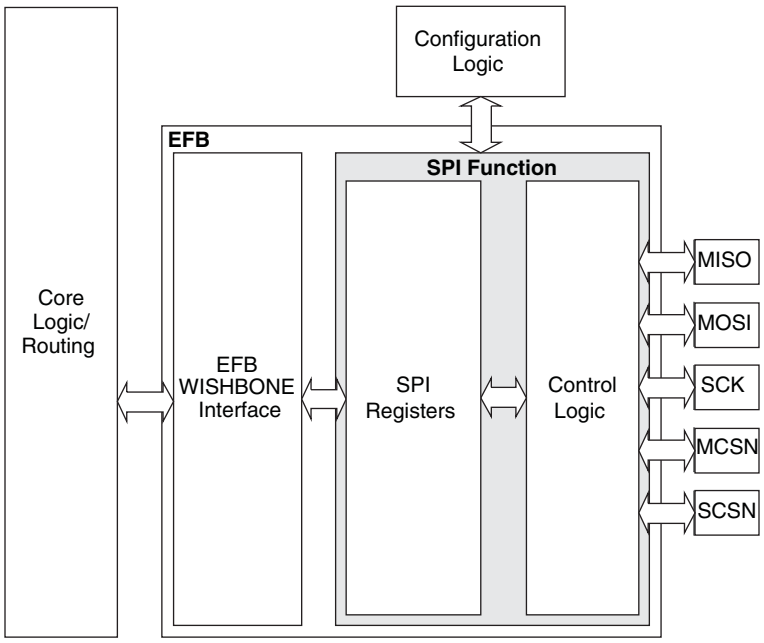


Table 2-16 describes the signals interfacing with the SPI cores.

Table 2-16. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
ufm_sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the User Flash Memory (UFM).
cfg_stdby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.

For more details on these embedded functions, please refer to TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices.

User Flash Memory (UFM)

MachXO2-640/U and higher density devices provide a User Flash Memory block, which can be used for a variety of applications including storing a portion of the configuration image, initializing EBRs, to store PROM data or, as a general purpose user Flash memory. The UFM block connects to the device core through the embedded function block WISHBONE interface. Users can also access the UFM block through the JTAG, I^2C and SPI interfaces of the device. The UFM block offers the following features:

- Non-volatile storage up to 256 kbits
- 100K write cycles
- Write access is performed page-wise; each page has 128 bits (16 bytes)
- Auto-increment addressing
- WISHBONE interface

For more information on the UFM, please refer to TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices.

Standby Mode and Power Saving Options

MachXO2 devices are available in three options for maximum flexibility: ZE, HC and HE devices. The ZE devices have ultra low static and dynamic power consumption. These devices use a 1.2 V core voltage that further reduces power consumption. The HC and HE devices are designed to provide high performance. The HC devices have a built-in voltage regulator to allow for 2.5 V V_{CC} and 3.3 V V_{CC} while the HE devices operate at 1.2 V V_{CC}.

MachXO2 devices have been designed with features that allow users to meet the static and dynamic power requirements of their applications by controlling various device subsystems such as the bandgap, power-on-reset circuitry, I/O bank controllers, power guard, on-chip oscillator, PLLs, etc. In order to maximize power savings, MachXO2 devices support an ultra low power Stand-by mode. While most of these features are available in all three device types, these features are mainly intended for use with MachXO2 ZE devices to manage power consumption.

In the stand-by mode the MachXO2 devices are powered on and configured. Internal logic, I/Os and memories are switched on and remain operational, as the user logic waits for an external input. The device enters this mode when the standby input of the standby controller is toggled or when an appropriate I^2C or JTAG instruction is issued by an external master. Various subsystems in the device such as the band gap, power-on-reset circuitry etc can be configured such that they are automatically turned “off” or go into a low power consumption state to save power when the device enters this state. Note that the MachXO2 devices are powered on when in standby mode and all power supplies should remain in the Recommended Operating Conditions.

sysIO Recommended Operating Conditions

Standard	V_{CCIO} (V)			V_{REF} (V)		
	Min.	Typ.	Max.	Min.	Typ.	Max.

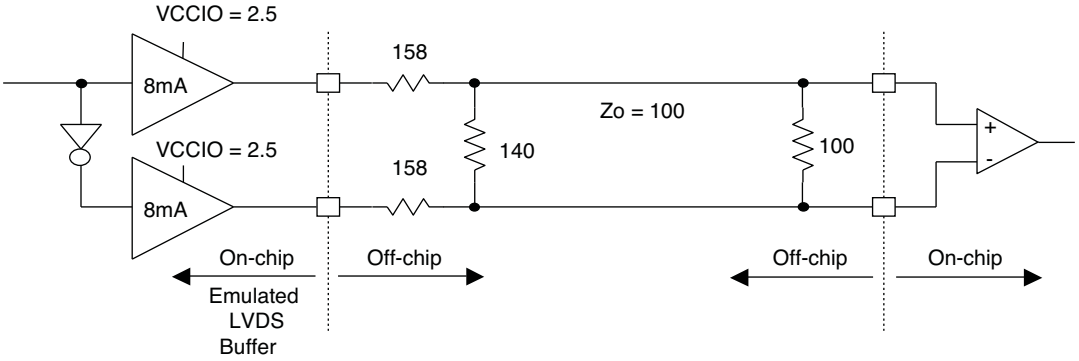
HSTL18D	1.71	1.8	1.89	—	—	—

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.
2. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
3. Input on the bottom bank of the MachXO2-640U, MachXO2-1200/U and larger devices only.
4. Supported only for inputs and BIDIs for all ZE devices, and –6 speed grade for HE and HC devices.

LVDS Emulation

MachXO2 devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Figure 3-1. LVDS Using External Resistors (LVDS25E)



Note: All resistors are ±1%.

	Oscillator Output Frequency (Industrial Grade Devices, –40 °C to 100 °C)	124.355	133	141.645	MHz
t_{DT}	Output Clock Duty Cycle	43	50	57	%
t_{OPJIT}[1]	Output Clock Period Jitter	0.01	0.012	0.02	UIPP
$t_{STABLEOSC}$	STDBY Low to Oscillator Stable	0.01	0.05	0.1	µs

1. Output Clock Period Jitter specified at 133 MHz. The values for lower frequencies will be smaller UIPP. The typical value for 133 MHz is 95 ps and for 2.08 MHz the typical value is 1.54 ns.

1. This part number has a tape and reel quantity of 5,000 units with a minimum order quantity of 10,000 units. Order quantities must be in increments of 5,000 units. For example, a 10,000 unit order will be shipped in two reels with one reel containing 5,000 units and the other reel with less than 5,000 units (depending on test yields). Unserviced backlog will be canceled.
2. This part number has a tape and reel quantity of 1,000 units with a minimum order quantity of 1,000. Order quantities must be in increments of 1,000 units. For example, a 5,000 unit order will be shipped as 5 reels of 1000 units each.
3. This part number has a tape and reel quantity of 50 units with a minimum order quantity of 50. Order quantities must be in increments of 50 units. For example, a 1,000 unit order will be shipped as 20 reels of 50 units each.

LCMXO2-2000UHE-6FG484I	2112	1.2 V	–6	Halogen-Free fpBGA	484	IND

R1 Device Specifications

The LCMXO2-1200ZE/HC "R1" devices have the same specifications as their Standard (non-R1) counterparts except as listed below. For more details on the R1 to Standard migration refer to AN8086, Designing for Migration from MachXO2-1200-R1 to Standard Non-R1) Devices.

- The User Flash Memory (UFM) cannot be programmed through the internal WISHBONE interface. It can still be programmed through the JTAG/SPI/I^2C ports.
- The on-chip differential input termination resistor value is higher than intended. It is approximately 200Ω as opposed to the intended 100Ω. It is recommended to use external termination resistors for differential inputs. The on-chip termination resistors can be disabled through Lattice design software.
- Soft Error Detection logic may not produce the correct result when it is run for the first time after configuration. To use this feature, discard the result from the first operation. Subsequent operations will produce the correct result.
- Under certain conditions, IIH exceeds data sheet specifications. The following table provides more details:

Condition	Clamp	Pad Rising IIH Max.	Pad Falling IIH Min.	Steady State Pad High IIH	Steady State Pad Low IIL
VPAD > VCCIO	OFF	1 mA	–1 mA	1 mA	10 µA
VPAD = VCCIO	ON	10 µA	–10 µA	10 µA	10 µA
VPAD = VCCIO	OFF	1 mA	–1 mA	1 mA	10 µA
VPAD < VCCIO	OFF	10 µA	–10 µA	10 µA	10 µA

- The user SPI interface does not operate correctly in some situations. During master read access and slave write access, the last byte received does not generate the RRDY interrupt.
- In GDDRX2, GDDRX4 and GDDR71 modes, ECLKSYNC may have a glitch in the output under certain conditions, leading to possible loss of synchronization.
- When using the hard I^2C IP core, the I^2C status registers I2C_1_SR and I2C_2_SR may not update correctly.
- PLL Lock signal will glitch high when coming out of standby. This glitch lasts for about 10 µsec before returning low.
- Dual boot only available on HC devices, requires tying VCC and VCCIO2 to the same 3.3 V or 2.5 V supply.
