Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

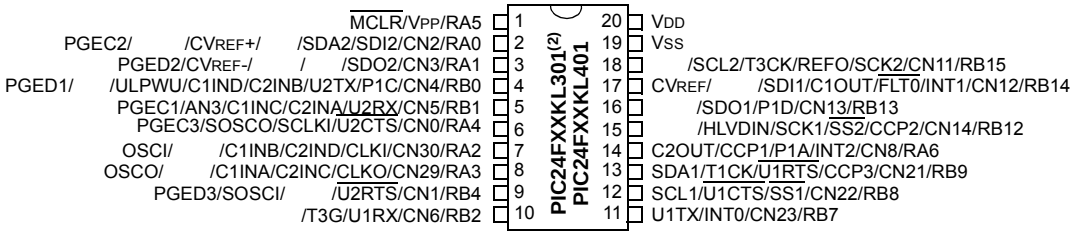
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

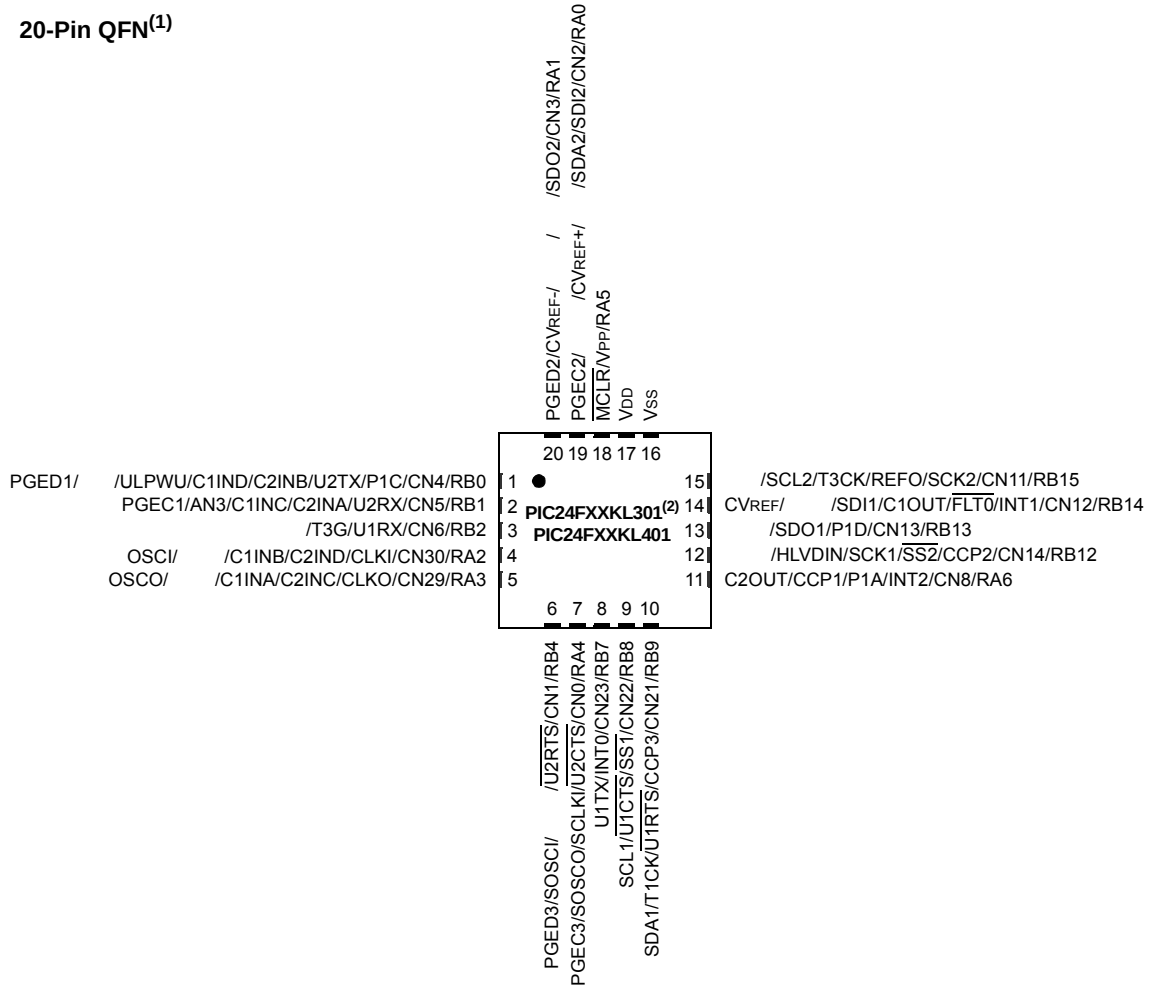
Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	18
Program Memory Size	8KB (2.75K x 24)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	20-SSOP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24f08kl301-i-ss

Pin Diagrams: PIC24FXXKL301/401

20-Pin PDIP/SSOP/SOIC(1)



20-Pin QFN(1)



Note 1: Analog features (indicated in) are not available on PIC24FXXKL301 devices.

2: Alternate location for I^2C™ functionality of MSSP1, as determined by the I2C1SEL Configuration bit.

1.0 DEVICE OVERVIEW

This document contains device-specific information for the following devices:

- PIC24F04KL100
- PIC24F04KL101
- PIC24F08KL200
- PIC24F08KL201
- PIC24F08KL301
- PIC24F08KL302
- PIC24F08KL401
- PIC24F16KL401
- PIC24F08KL402
- PIC24F16KL402

The PIC24F16KL402 family adds an entire range of economical, low pin count and low-power devices to Microchip's portfolio of 16-bit microcontrollers. Aimed at applications that require low-power consumption but more computational ability than an 8-bit platform can provide, these devices offer a range of tailored peripheral sets that allow the designer to optimize both price point and features with no sacrifice of functionality.

1.1 Core Features

1.1.1 16-BIT ARCHITECTURE

Central to all PIC24F devices is the 16-bit modified Harvard architecture, first introduced with Microchip's dsPIC® digital signal controllers. The PIC24F CPU core offers a wide range of enhancements, such as:

- 16-bit data and 24-bit address paths with the ability to move information between data and memory spaces
- Linear addressing of up to 12 Mbytes (program space) and 64 Kbytes (data)
- A 16-element Working register array with built-in software stack support
- A 17 x 17 hardware multiplier with support for integer math
- Hardware support for 32-bit by 16-bit division
- An instruction set that supports multiple addressing modes and is optimized for high-level languages, such as C
- Operational performance up to 16 MIPS

1.1.2 POWER-SAVING TECHNOLOGY

All of the devices in the PIC24F16KL402 family incorporate a range of features that can significantly reduce power consumption during operation. Key features include:

- **On-the-Fly Clock Switching:** The device clock can be changed under software control to the Timer1 source, or the internal, Low-Power RC (LPRC) oscillator during operation, allowing the user to incorporate power-saving ideas into their software designs.
- **Doze Mode Operation:** When timing-sensitive applications, such as serial communications, require the uninterrupted operation of peripherals, the CPU clock speed can be selectively reduced, allowing incremental power savings without missing a beat.
- **Instruction-Based Power-Saving Modes:** The microcontroller can suspend all operations, or selectively shut down its core while leaving its peripherals active, with a single instruction in software.

1.1.3 OSCILLATOR OPTIONS AND FEATURES

The PIC24F16KL402 family offers five different oscillator options, allowing users a range of choices in developing application hardware. These include:

- Two Crystal modes using crystals or ceramic resonators.
- Two External Clock modes offering the option of a divide-by-2 clock output.
- Two Fast Internal Oscillators (FRCs): One with a nominal 8 MHz output and the other with a nominal 500 kHz output. These outputs can also be divided under software control to provide clock speed as low as 31 kHz or 2 kHz.
- A Phase Locked Loop (PLL) frequency multiplier, available to the External Oscillator modes and the 8 MHz FRC Oscillator, which allows clock speeds of up to 32 MHz.
- A separate Internal RC Oscillator (LPRC) with a fixed 31 kHz output, which provides a low-power option for timing-insensitive applications.

The internal oscillator block also provides a stable reference source for the Fail-Safe Clock Monitor (FSCM). This option constantly monitors the main clock source against a reference signal provided by the internal oscillator and enables the controller to switch to the internal oscillator, allowing for continued low-speed operation or a safe application shutdown.

1.1.4 EASY MIGRATION

The consistent pinout scheme used throughout the entire family also helps in migrating to the next larger device. This is true when moving between devices with the same pin count, or even jumping from 20-pin or 28-pin devices to 44-pin/48-pin devices.

The PIC24F family is pin compatible with devices in the dsPIC33 family, and shares some compatibility with the pinout schema for PIC18 and dsPIC30. This extends the ability of applications to grow, from the relatively simple, to the powerful and complex.

TABLE 1-4: PIC24F16KL40X/30X FAMILY PINOUT DESCRIPTIONS (CONTINUED)

4.3.2 DATA ACCESS FROM PROGRAM MEMORY AND DATA EEPROM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program memory without going through data space. It also offers a direct method of reading or writing a word of any address within data EEPROM memory. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

Note:	The TBLRDH and TBLWTH instructions are not used while accessing data EEPROM memory.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two, 16-bit word-wide address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space which contains the least significant data word, and TBLRDH and TBLWTH access the space which contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

1. TBLRDL (Table Read Low): In Word mode, it maps the lower word of the program space location (P<15:0>) to a data address (D<15:0>).

   In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when the byte select is '1'; the lower byte is selected when it is '0'.

2. TBLRDH (Table Read High): In Word mode, it maps the entire upper word of a program address (P<23:16>) to a data address. Note that D<15:8>, the 'phantom' byte, will always be '0'.

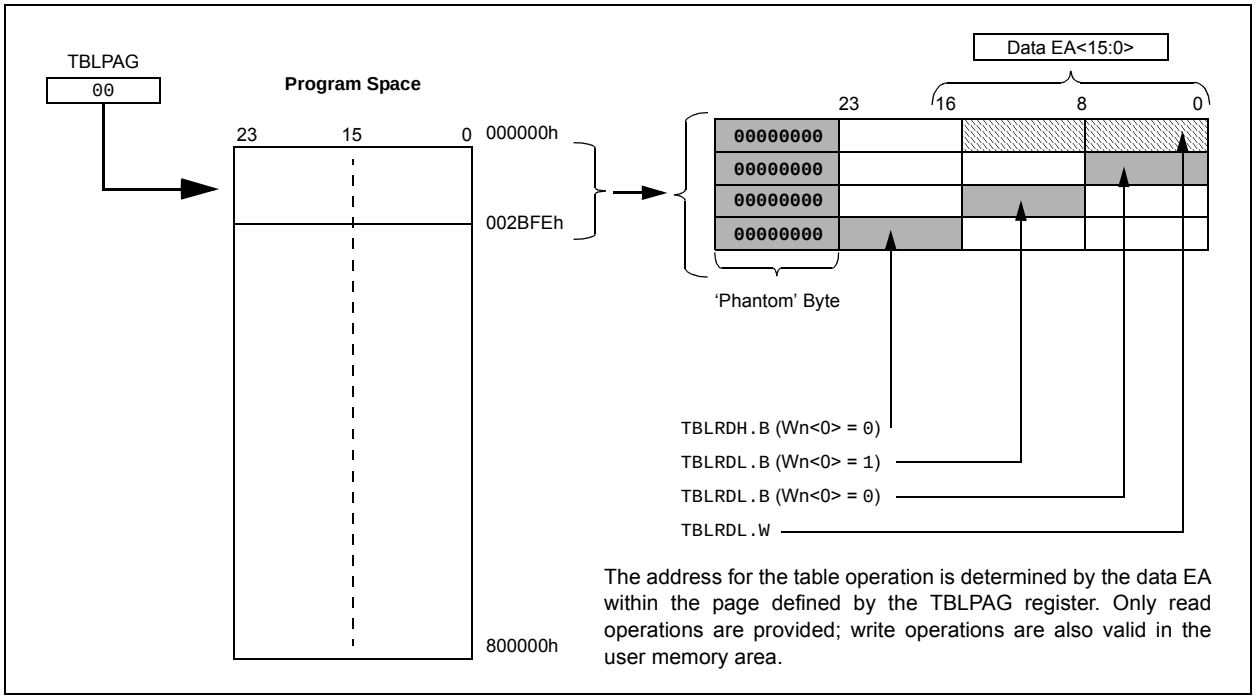
   In Byte mode, it maps the upper or lower byte of the program word to D<7:0> of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (byte select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in **Section 5.0 "Flash Program Memory"**.

For all table operations, the area of program memory space to be accessed is determined by the Table Memory Page Address register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

Note:	Only Table Read operations will execute in the configuration memory space, and only then, in implemented areas, such as the Device ID. Table write operations are not allowed.

FIGURE 4-6: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS



The address for the table operation is determined by the data EA within the page defined by the TBLPAG register. Only read operations are provided; write operations are also valid in the user memory area.

4.3.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into a 16K word page of the program space. This provides transparent access of stored constant data from the data space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the data space occurs if the MSb of the data space EA is '1' and PSV is enabled by setting the PSV bit in the CPU Control (CORCON<2>) register. The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page Address (PSVPAG) register. This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with 15 bits of the EA functioning as the lower bits.

By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads from this area add an additional cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address, 8000h and higher, maps directly into a corresponding program memory address (see Figure 4-7), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space location, used as data, should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note:	PSV access is temporarily disabled during Table Reads/Writes.

For operations that use PSV and are executed outside of a REPEAT loop, the MOV and MOV.D instructions will require one instruction cycle, in addition to the specified execution time. All other instructions will require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles, in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

- 0 = Sync Break transmission is disabled or completed

bit 10 **UTXEN:** UARTx Transmit Enable bit
- 1 = Transmit is enabled; UxTX pin is controlled by UARTx
- 0 = Transmit is disabled; any pending transmission is aborted and the buffer is reset. UxTX pin is controlled by the PORT register.

bit 9 **UTXBF:** UARTx Transmit Buffer Full Status bit (read-only)
- 1 = Transmit buffer is full
- 0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)
- 1 = Transmit Shift Register is empty and the transmit buffer is empty (the last transmission has completed)
- 0 = Transmit Shift Register is not empty; a transmission is in progress or queued

bit 7-6 **URXISEL<1:0>:** UARTx Receive Interrupt Mode Selection bits
- 11 = Interrupt is set on the RSR transfer, making the receive buffer full (i.e., has 2 data characters)
- 10 = Reserved
- 01 = Reserved
- 00 = Interrupt is set when any character is received and transferred from the RSR to the receive buffer; receive buffer has one or more characters

APPENDIX A: REVISION HISTORY

Revision A (September 2011)

Original data sheet for the PIC24F16KL402 family of devices.

Revision B (November 2011)

Updates DC Specifications in Tables 26-6 through 26-9 (all Typical and Maximum values).

Updates AC Specifications in Tables 26-7 through 26-30 (SPI Timing Requirements) with the addition of the FSCK specification.

Other minor typographic corrections throughout.

Revision C (October 2013)

Adds +125°C Extended Temperature information.

Updates several packaging drawings in **Section 27.0 "Packaging Information"**. Other minor typographic corrections throughout.

APPENDIX B: MIGRATING FROM PIC18/PIC24 TO PIC24F16KL402

The PIC24F16KL402 family combines traditional PIC18 peripherals with a faster PIC24 core to provide a low-cost, high-performance microcontroller with low-power consumption.

Code written for PIC18 devices can be migrated to the PIC24F16KL402 by using a C compiler that generates PIC24 machine level instructions. Assembly language code will need to be rewritten using PIC24 instructions. The PIC24 instruction set shares similarities to the PIC18 instruction set, which should ease porting of assembly code. Application code will require changes to support certain PIC24 peripherals.

Code written for PIC24 devices can be migrated to the PIC24F16KL402 without many code changes. Certain peripherals, however, will require application changes to support modules that were traditionally available only on PIC18 devices.

Refer to Table B-1 for a list of peripheral modules on the PIC24F16KL402 and where they originated from.

TABLE B-1: TABLE B-1: PIC24F16KL402 PERIPHERAL MODULE ORIGINATING ARCHITECTURE

Peripheral Module	PIC18	PIC24
ECCP/CCP	X	—
MSSP (I^2C™/SPI)	X	—
Timer2/4 (8-bit)	X	—
Timer3 (16-bit)	X	—
Timer1 (16-bit)	—	X
10-Bit A/D Converter	—	X
Comparator	—	X
Comparator Voltage Reference	—	X
UART	—	X
HLVD	—	X
