Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	18
Program Memory Size	16KB (5.5K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 12x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	20-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24f16kl401t-i-so

TABLE 1-2: DEVICE FEATURES FOR PIC24F16KL40X/30X DEVICES

Features	PIC24F16KL402	PIC24F08KL402	PIC24F08KL302	PIC24F16KL401	PIC24F08KL401	PIC24F08KL301
Operating Frequency	DC – 32 MHz					
Program Memory (bytes)	16K	8K	8K	16K	8K	8K
Program Memory (instructions)	5632	2816	2816	5632	2816	2816
Data Memory (bytes)	1024	1024	1024	1024	1024	1024
Data EEPROM Memory (bytes)	512	512	256	512	512	256
Interrupt Sources (soft vectors/NMI traps)	31 (27/4)	31 (27/4)	30 (26/4)	31 (27/4)	31 (27/4)	30 (26/4)
I/O Ports	PORTA<7:0> PORTB<15:0>			PORTA<6:0> PORTB<15:12,9:7,4,2:0>		
Total I/O Pins	24			18		
Timers (8/16-bit)	2/2	2/2	2/2	2/2	2/2	2/2
Capture/Compare/PWM modules:						
Total	3	3	3	3	3	3
Enhanced CCP	1	1	1	1	1	1
Input Change Notification Interrupt	23	23	23	17	17	17
Serial Communications:						
UART	2	2	2	2	2	2

2.4 ICSP Pins

The PGC and PGD pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of ohms, not to exceed 100Ω.

Pull-up resistors, series diodes and capacitors on the PGC and PGD pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits, and pin Input Voltage High (V_{IH}) and Input Voltage Low (V_{IL}) requirements.

For device emulation, ensure that the “Communication Channel Select” (i.e., PGCx/PGDx) pins, programmed into the device, matches the physical connections for the ICSP to the Microchip debugger/emulator tool.

For more information on available Microchip development tools connection requirements, refer to **Section 24.0 “Development Support”**.

2.5 External Oscillator Pins

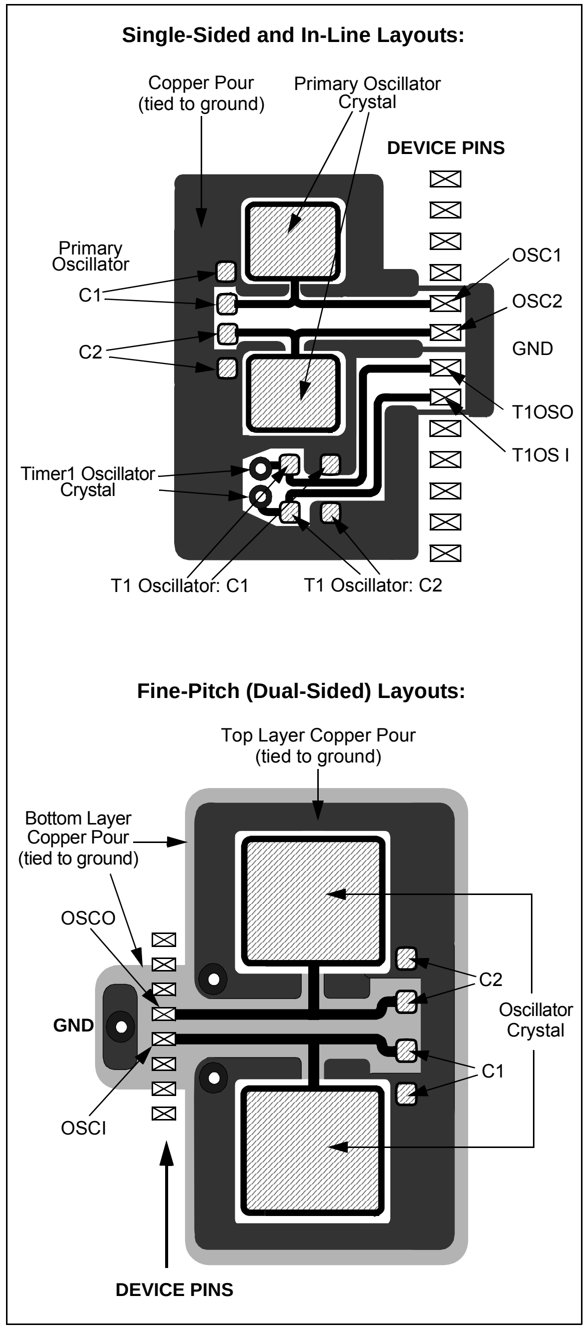
Many microcontrollers have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 9.0 “Oscillator Configuration”** for details).

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins with no more than 0.5 inch (12 mm) between the circuit components and the pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

Layout suggestions are shown in Figure 2-3. In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT



In planning the application’s routing and I/O assignments, ensure that adjacent port pins and other signals, in close proximity to the oscillator, are benign (i.e., free of high frequencies, short rise and fall times, and other similar noise).

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address, as shown in Figure 4-2.

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with data memory space addressing and makes it possible to access data in the program memory space.

4.1.2 HARD MEMORY VECTORS

All PIC24F devices reserve the addresses between 00000h and 000200h for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A `GOTO` instruction is programmed by the user at 000000h, with the actual address for the start of code at 000002h.

PIC24F devices also have two Interrupt Vector Tables (IVT), located from 000004h to 0000FFh and 000104h to 0001FFh. These vector tables allow each of the many device interrupt sources to be handled by separate ISRs. A more detailed discussion of the Interrupt Vector Tables is provided in **Section 8.1 "Interrupt Vector Table (IVT)"**.

4.1.3 DATA EEPROM

In the PIC24F16KL402 family, the data EEPROM is mapped to the top of the user program memory space, starting at address, 7FFE00, and expanding up to address, 7FFFFF.

The data EEPROM is organized as 16-bit wide memory and 256 words deep. This memory is accessed using Table Read and Table Write operations, similar to the user code memory.

4.1.4 DEVICE CONFIGURATION WORDS

Table 4-1 provides the addresses of the device Configuration Words for the PIC24F16KL402 family. Their location in the memory map is shown in Figure 4-1.

For more information on device Configuration Words, see **Section 23.0 "Special Features"**.

TABLE 4-1: DEVICE CONFIGURATION WORDS FOR PIC24F16KL402 FAMILY DEVICES

Configuration Words	Configuration Word Addresses
FBS	F80000

Note 1: These bits and/or registers are unimplemented on PIC24FXXKL10X and PIC24FXXKL20X family devices; read as ‘0’.

4.2.5 SOFTWARE STACK

In addition to its use as a Working register, the W15 register in PIC24F devices is also used as a Software Stack Pointer. The pointer always points to the first available free word and grows from lower to higher addresses. It predecrements for stack pops and post-increments for stack pushes, as shown in Figure 4-4.

Note that for a PC push during any `CALL` instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

> **Note:** A PC push during exception processing will concatenate the SRL register to the MSB of the PC prior to the push.

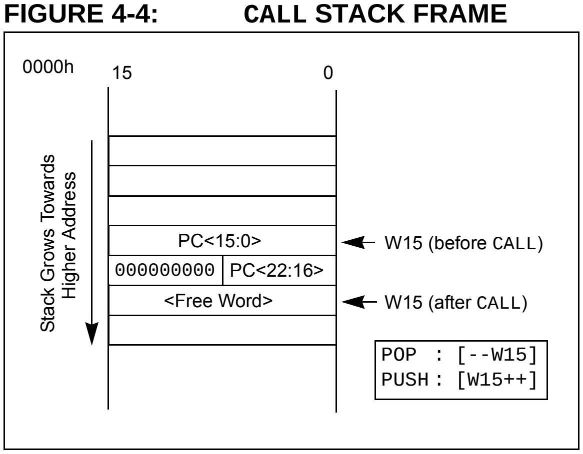
The Stack Pointer Limit Value (SPLIM) register, associated with the Stack Pointer, sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '`0`' as all stack operations must be word-aligned. Whenever an EA is generated, using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal, and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation.

Thus, for example, if it is desirable to cause a stack error trap when the stack grows beyond address, 0DF6, in RAM, initialize the SPLIM with the value, 0DF4.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0800h. This prevents the stack from interfering with the Special Function Register (SFR) space.

> **Note:** A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-4: CALL STACK FRAME



4.3 Interfacing Program and Data Memory Spaces

The PIC24F architecture uses a 24-bit wide program space and 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Apart from the normal execution, the PIC24F architecture provides two methods by which the program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space, PSV

Table instructions allow an application to read or write small areas of the program memory. This makes the method ideal for accessing data tables that need to be updated from time to time. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. It can only access the least significant word (lsw) of the program word.

4.3.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Memory Page Address register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit (MSb) of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = `0`) or the configuration memory (TBLPAG<7> = `1`).

For remapping operations, the 8-bit Program Space Visibility Page Address register (PSVPAG) is used to define a 16K word page in the program space. When the MSb of the EA is '`1`', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike the table operations, this limits remapping operations strictly to the user memory area.

Table 4-20 and Figure 4-5 show how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> bits refer to a program space word, whereas the D<15:0> bits refer to a data space word.

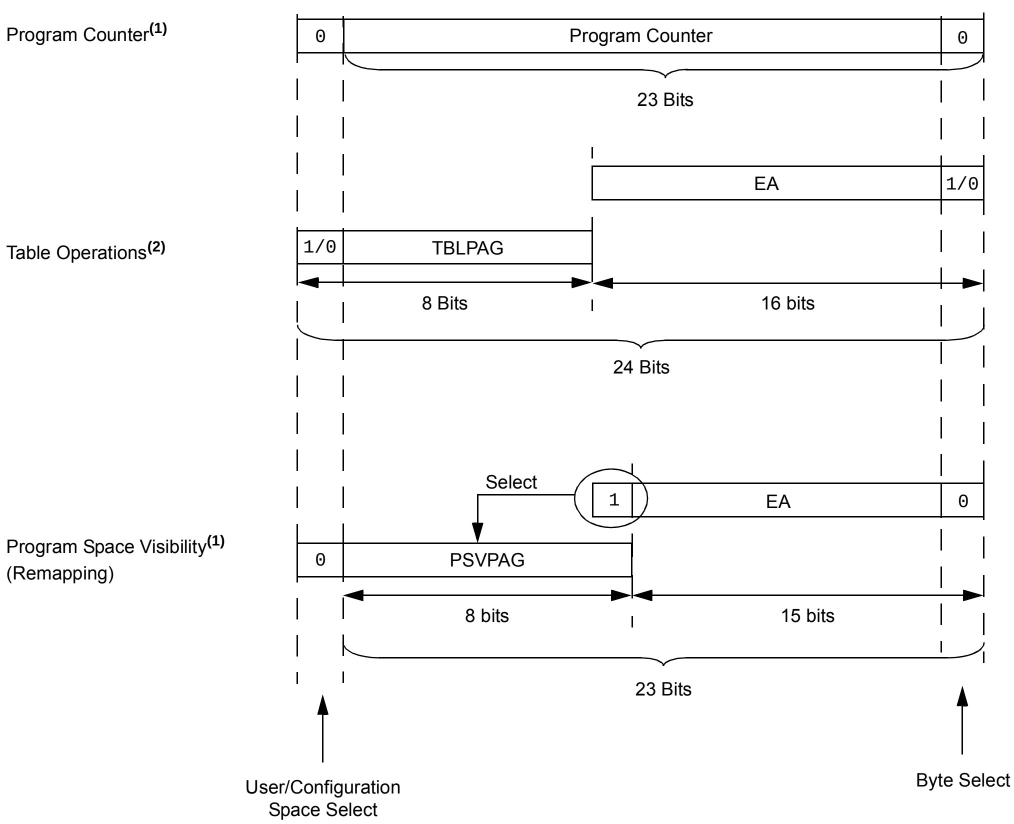
TABLE 4-20: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		<23>	<22:16>	<15>	<14:1>	<0>
Instruction Access (Code Execution)	User	0	PC<22:1>			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG<7:0>		Data EA<15:0>		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG<7:0>		Data EA<15:0>		
		1xxx xxxx		xxxx xxxx xxxx xxxx		
Program Space Visibility (Block Remap/Read)	User	0	PSVPAG<7:0>(2)		Data EA<14:0>(1)	
		0	xxxx xxxx		xxx xxxx xxxx xxxx	

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

2: PSVPAG can have only two values ('00' to access program memory and FF to access data EEPROM) on PIC24F16KL402 family devices.

FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and data spaces.

2: Table operations are not required to be word-aligned. Table read operations are permitted in the configuration memory space.

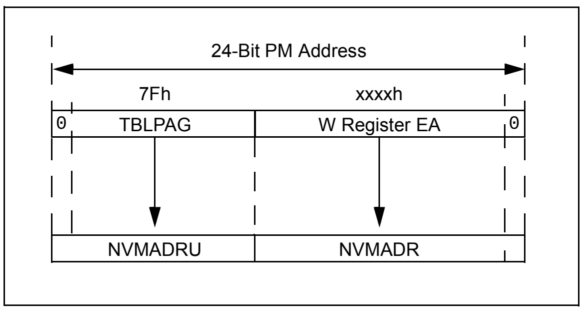
6.3 NVM Address Register

As with Flash program memory, the NVM Address Registers, NVMADRU and NVMADR, form the 24-bit Effective Address (EA) of the selected row or word for data EEPROM operations. The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA. These registers are not mapped into the Special Function Register (SFR) space; instead, they directly capture the EA<23:0> of the last Table Write instruction that has been executed and selects the data EEPROM row to erase. Figure 6-1 depicts the program memory EA that is formed for programming and erase operations.

Like program memory operations, the Least Significant bit (LSb) of NVMADR is restricted to even addresses. This is because any given address in the data EEPROM space consists of only the lower word of the program memory width; the upper word, including the uppermost "phantom byte", is unavailable. This means that the LSb of a data EEPROM address will always be '0'.

Similarly, the Most Significant bit (MSb) of NVMADRU is always '0', since all addresses lie in the user program space.

FIGURE 6-1: DATA EEPROM ADDRESSING WITH TBLPAG AND NVM ADDRESS REGISTERS



6.4 Data EEPROM Operations

The EEPROM block is accessed using Table Read and Table Write operations, similar to those used for program memory. The `TBLWTH` and `TBLRDH` instructions are not required for data EEPROM operations since the memory is only 16 bits wide (data on the lower address is valid only). The following programming operations can be performed on the data EEPROM:

- Erase one, four or eight words
- Bulk erase the entire data EEPROM
- Write one word
- Read one word

Note:	Unexpected results will be obtained if the user attempts to read the EEPROM while a programming or erase operation is underway. The C30 C compiler includes library procedures to automatically perform the Table Read and Table Write operations, manage the Table Pointer and write buffers, and unlock and initiate memory write sequences. This eliminates the need to create assembler macros or time critical routines in C for each application.

The library procedures are used in the code examples detailed in the following sections. General descriptions of each process are provided for users who are not using the C30 compiler libraries.

7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 7-3. Note that the System Reset Signal, SYSRST, is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable SYSRST delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the SYSRST signal is released.

TABLE 7-3: RESET DELAY TIMES FOR VARIOUS DEVICE RESETS

Reset Type	Clock Source	SYSRST Delay	System Clock Delay	Notes
POR(6)	EC	TPOR + TPWRT	—	**1, 2**
	FRC, FRCDIV	TPOR + TPWRT	TFRC	**1, 2, 3**
	LPRC	TPOR + TPWRT	TLPRC	**1, 2, 3**
	ECPLL	TPOR + TPWRT	TLOCK	**1, 2, 4**
	FRCPLL	TPOR + TPWRT	TFRC + TLOCK	**1, 2, 3, 4**
	XT, HS, SOSC	TPOR+ TPWRT	TOST	**1, 2, 5**
	XTPLL, HSPLL	TPOR + TPWRT	TOST + TLOCK	**1, 2, 4, 5**
BOR	EC	TPWRT	—	**2**
	FRC, FRCDIV	TPWRT	TFRC	**2, 3**
	LPRC	TPWRT	TLPRC	**2, 3**
	ECPLL	TPWRT	TLOCK	**2, 4**
	FRCPLL	TPWRT	TFRC + TLOCK	**2, 3, 4**
	XT, HS, SOSC	TPWRT	TOST	**2, 5**
	XTPLL, HSPLL	TPWRT	TFRC + TLOCK	**2, 3, 4**
All Others	Any Clock	—	—	**None**

Note 1: TPOR = Power-on Reset delay.

2: TPWRT = 64 ms nominal if the Power-up Timer is enabled; otherwise, it is zero.

3: TFRC and TLPRC = RC oscillator start-up times.

4: TLOCK = PLL lock time.

5: TOST = Oscillator Start-up Timer (OST). A 10-bit counter waits 1024 oscillator periods before releasing the oscillator clock to the system.

6: If Two-Speed Start-up is enabled, regardless of the primary oscillator selected, the device starts with FRC, and in such cases, FRC start-up time is valid.

Note:	For detailed operating frequency and timing specifications, see **Section 26.0 “Electrical Characteristics”**.

•
•
•
001 = Interrupt is Priority 1
000 = Interrupt source is disabled

bit 7-0 **Unimplemented:** Read as ‘0’

9.3 Control Registers

The operation of the oscillator is controlled by three Special Function Registers (SFRs):

- OSCCON
- CLKDIV
- OSCTUN

The OSCCON register (Register 9-1) is the main control register for the oscillator. It controls clock source switching and allows the monitoring of clock sources.

The Clock Divider register (Register 9-2) controls the features associated with Doze mode, as well as the postscaler for the FRC oscillator.

The FRC Oscillator Tune register (Register 9-3) allows the user to fine-tune the FRC oscillator. OSCTUN functionality has been provided to help customers compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step-size is an approximation and is neither characterized nor tested.

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER

U-0	R-0, HSC	R-0, HSC	R-0, HSC	U-0	R/W-x(1)	R/W-x(1)	R/W-x(1)
—	COSC2	COSC1	COSC0	—	NOSC2	NOSC1	NOSC0
bit 15							bit 8

R/SO-0, HSC	U-0	R-0, HSC(2)	U-0	R/CO-0, HS	R/W-0(3)	R/W-0	R/W-0
CLKLOCK	—	LOCK	—	CF	SOSCDRV	SOSCEN	OSWEN
bit 7							bit 0

Legend:	HSC = Hardware Settable/Clearable bit		
HS = Hardware Settable bit	CO = Clearable Only bit	SO = Settable Only bit	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as ‘0’	
-n = Value at POR	‘1’ = Bit is set	‘0’ = Bit is cleared	x = Bit is unknown

bit 15 **Unimplemented:** Read as ‘0’

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits
111 = 8 MHz Fast RC Oscillator with Postscaler (FRCDIV)
110 = 500 kHz Low-Power Fast RC Oscillator (FRC) with Postscaler (LPFRCDIV)
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = 8 MHz FRC Oscillator with Postscaler and PLL module (FRCPLL)
000 = 8 MHz FRC Oscillator (FRC)

bit 11 **Unimplemented:** Read as ‘0’

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits(1)
111 = 8 MHz Fast RC Oscillator with Postscaler (FRCDIV)
110 = 500 kHz Low-Power Fast RC Oscillator (FRC) with Postscaler (LPFRCDIV)
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = 8 MHz FRC Oscillator with Postscaler and PLL module (FRCPLL)
000 = 8 MHz FRC Oscillator (FRC)

Note 1: Reset values for these bits are determined by the FNOSC<2:0> Configuration bits.
2: Also resets to ‘0’ during any valid clock switch or whenever a non-PLL Clock mode is selected.
3: When SOSC is selected to run from a digital clock input rather than an external crystal (SOSCSRC = 0), this bit has no effect.

REGISTER 19-4: AD1CHS: A/D INPUT SELECT REGISTER

TABLE 26-23: RESET, WATCHDOG TIMER, OSCILLATOR START-UP TIMER, POWER-UP TIMER AND BROWN-OUT RESET TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 1.8V to 3.6V Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	Symbol	Characteristic	Min.	Typ(1)	Max.	Units	Conditions
SY10	TmcL	MCLR Pulse Width (low)	2	—	—	μs	
SY11	TPWRT	Power-up Timer Period	50	64	90	ms	
SY12	TPOR	Power-on Reset Delay	1	5	10	μs	
SY13	TIOZ	I/O High-Impedance from MCLR Low or Watchdog Timer Reset	—	—	100	ns	
SY20	TWDT	Watchdog Timer Time-out Period	0.85	1.0	1.15	ms	1.32 prescaler
			3.4	4.0	4.6	ms	1:128 prescaler
SY25	TBOR	Brown-out Reset Pulse Width	1	—	—	μs	
SY45	TRST	Internal State Reset Time	—	5	—	μs	
SY55	TLOCK	PLL Start-up Time	—	100	—	μs	
SY65	TOST	Oscillator Start-up Time	—	1024	—	TOSC	
SY71	TPM	Program Memory Wake-up Time	—	1	—	μs	Sleep wake-up with PMSLP = 0

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

TABLE 26-24: COMPARATOR TIMINGS

Param No.	Symbol	Characteristic	Min	Typ	Max	Units	Comments
300	TRESP	Response Time(1,2)	—	150	400	ns	
301	TMC2OV	Comparator Mode Change to Output Valid(2)	—	—	10	μs	

Note 1: Response time is measured with one comparator input at (VDD – 1.5)/2, while the other input transitions from VSS to VDD.

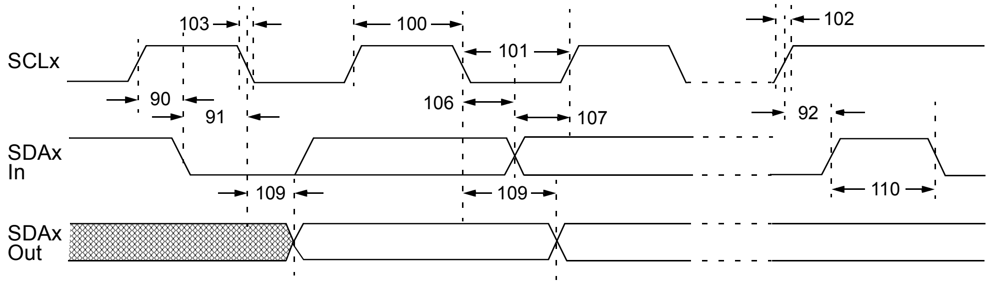
2: Parameters are characterized but not tested.

TABLE 26-25: COMPARATOR VOLTAGE REFERENCE SETTLING TIME SPECIFICATIONS

Param No.	Symbol	Characteristic	Min	Typ	Max	Units	Comments
VR310	TSET	Settling Time(1)	—	—	10	μs	

Note 1: Settling time is measured while CVRSS = 1 and the CVR<3:0> bits transition from ‘0000’ to ‘1111’.

FIGURE 26-14: MSSPx I²C™ BUS DATA TIMING



Note: Refer to Figure 26-3 for load conditions.

TABLE 26-34: I²C™ BUS DATA REQUIREMENTS (MASTER MODE)

Param. No.	Symbol	Characteristic		Min	Max	Units	Conditions
100	THIGH	Clock High Time	100 kHz mode	2(TOSC)(BRG + 1)	—	—	
			400 kHz mode	2(TOSC)(BRG + 1)	—	—	
101	TLOW	Clock Low Time	100 kHz mode	2(TOSC)(BRG + 1)	—	—	
			400 kHz mode	2(TOSC)(BRG + 1)	—	—	
102	TR	SDAx and SCLx Rise Time	100 kHz mode	—	1000	ns	CB is specified to be from 10 to 400 pF
			400 kHz mode	20 + 0.1 CB	300	ns	
103	TF	SDAx and SCLx Fall Time	100 kHz mode	—	300	ns	CB is specified to be from 10 to 400 pF
			400 kHz mode	20 + 0.1 CB	300	ns	
90	TSU:STA	Start Condition Setup Time	100 kHz mode	2(TOSC)(BRG + 1)	—	—	Only relevant for Repeated Start condition
			400 kHz mode	2(TOSC)(BRG + 1)	—	—	
91	THD:STA	Start Condition Hold Time	100 kHz mode	2(TOSC)(BRG + 1)	—	—	After this period, the first clock pulse is generated
			400 kHz mode	2(TOSC)(BRG + 1)	—	—	
106	THD:DAT	Data Input Hold Time	100 kHz mode	0	—	ns	
			400 kHz mode	0	0.9	μs	
107	TSU:DAT	Data Input Setup Time	100 kHz mode	250	—	ns	**(Note 1)**
			400 kHz mode	100	—	ns	
92	TSU:STO	Stop Condition Setup Time	100 kHz mode	2(TOSC)(BRG + 1)	—	—	
			400 kHz mode	2(TOSC)(BRG + 1)	—	—	
109	TAA	Output Valid from Clock	100 kHz mode	—	3500	ns	
			400 kHz mode	—	1000	ns	
110	TBUF	Bus Free Time	100 kHz mode	4.7	—	μs	Time the bus must be free before a new transmission can start
			400 kHz mode	1.3	—	μs	
D102	CB	Bus Capacitive Loading		—	400	pF	

Note 1: A Fast mode I²C bus device can be used in a Standard mode I²C bus system, but Parameter 107 ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCLx signal. If such a device does stretch the LOW period of the SCLx signal, it must output the next data bit to the SDAx line, Parameter 102 + Parameter 107 = 1000 + 250 = 1250 ns (for 100 kHz mode), before the SCLx line is released.
