Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Digitally Controlled Impedance (DCI)

Today's chip output signals with fast edge rates require termination to prevent reflections and maintain signal integrity. High pin count packages (especially ball grid arrays) can not accommodate external termination resistors.

Virtex-II Pro XCITE DCI provides controlled impedance drivers and on-chip termination for single-ended and differential I/Os. This eliminates the need for external resistors and improves signal integrity. The DCI feature can be used on any IOB by selecting one of the DCI I/O standards.

When applied to inputs, DCI provides input parallel termination. When applied to outputs, DCI provides controlled impedance drivers (series termination) or output parallel termination.

DCI operates independently on each I/O bank. When a DCI I/O standard is used in a particular I/O bank, external reference resistors must be connected to two dual-function pins on the bank. These resistors, voltage reference of N transistor (VRN) and the voltage reference of P transistor (VRP) are shown in Figure 26.

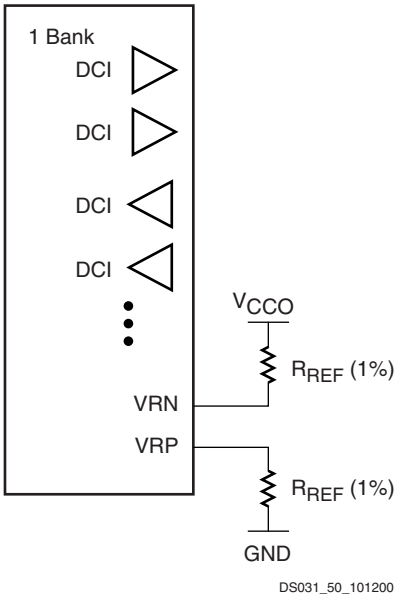

Figure 26: **DCI in a Virtex-II Pro Bank**

When used with a terminated I/O standard, the value of the resistors are specified by the standard (typically 50Ω). When used with a controlled impedance driver, the resistors set the output impedance of the driver within the specified range (20Ω to 100Ω). For all series and parallel terminations listed in Table 13 and Table 14, the reference resistors must have the same value for any given bank. One percent resistors are recommended.

The DCI system adjusts the I/O impedance to match the two external reference resistors, or half of the reference resistors, and compensates for impedance changes due to voltage and/or temperature fluctuations. The adjustment is done by turning parallel transistors in the IOB on or off.

Controlled Impedance Drivers (Series Termination)

DCI can be used to provide a buffer with a controlled output impedance. It is desirable for this output impedance to match the transmission line impedance (Z_0). Virtex-II Pro input buffers also support LVDCI and LVDCI_DV2.

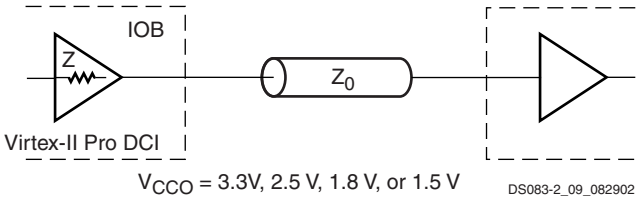

Figure 27: **Internal Series Termination**

Table 13: **SelectIO-Ultra Controlled Impedance Buffers**

V_{CCO}	DCI	DCI Half Impedance
3.3V	LVDCI_33	N/A
2.5V	LVDCI_25	LVDCI_DV2_25
1.8V	LVDCI_18	LVDCI_DV2_18
1.5V	LVDCI_15	LVDCI_DV2_15

Controlled Impedance Terminations (Parallel)

DCI also provides on-chip termination for SSTL2, SSTL18, HSTL (Class I, II, III, or IV), LVDS_25, LVDSEXT_25, and GTL/GTLP receivers or transmitters on bidirectional lines. Table 14 and Table 15 list the on-chip parallel terminations available in Virtex-II Pro devices. V_{CCO} must be set according to Table 10. There is a V_{CCO} requirement for GTL_DCI and GTLP_DCI, due to the on-chip termination resistor.

Notes:
1. SSTL compatible.

3. NO_CHANGE

The NO_CHANGE option maintains the content of the output registers, regardless of the write operation. The clock edge during the write mode has no effect on the content of the data output register DO. When the port is configured as NO_CHANGE, only a read operation loads a new value in the output register DO, as shown in Figure 51.

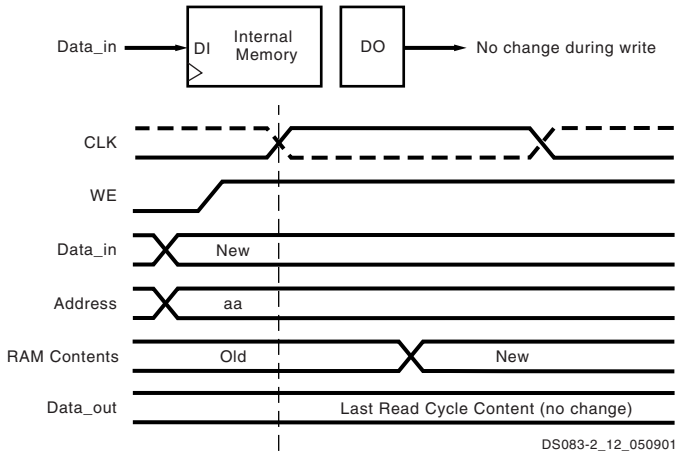

Figure 51: **NO_CHANGE Mode**

Control Pins and Attributes

Virtex-II Pro SelectRAM+ memory has two independent ports with the control signals described in Table 24. All control inputs including the clock have an optional inversion.

Table 24: **Control Functions**

Control Signal	Function
CLK	Read and Write Clock
EN	Enable affects Read, Write, Set, Reset
WE	Write Enable
SSR	Set DO register to SRVAL (attribute)

Initial memory content is determined by the INIT_xx attributes. Separate attributes determine the output register value after device configuration (INIT) and SSR is asserted (SRVAL). Both attributes (INIT_B and SRVAL) are available for each port when a block SelectRAM+ resource is configured as dual-port RAM.

Total Amount of SelectRAM+ Memory

Virtex-II Pro SelectRAM+ memory blocks are organized in multiple columns. The number of blocks per column depends on the row size, the number of Processor Blocks, and the number of RocketIO transceivers.

Table 25 shows the number of columns as well as the total amount of block SelectRAM+ memory available for each Virtex-II Pro device. The 18 Kb SelectRAM+ blocks are cascadable to implement deeper or wider single- or dual-port memory resources.
