### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Output Swing and Pre-emphasis

The output swing and pre-emphasis levels of the RocketIO MGTs are fully programmable. Each is controlled via attributes at configuration, but can be modified via partial reconfiguration.

The programmable output swing control can adjust the differential output level between 400 mV and 800 mV in four increments of 100 mV.

With pre-emphasis, the differential voltage swing is boosted to create a stronger rising waveform. This method compensates for high-frequency loss in the transmission media that would otherwise limit the magnitude of this waveform. Lossy transmission lines cause the dissipation of electrical energy. This pre-emphasis technique extends the distance that signals can be driven down lossy line media and increases the signal-to-noise ratio at the receiver.

### Functional Description: Processor Block

This section briefly describes the interfaces and components of the Processor Block. The subsequent section, **Functional Description: Embedded PowerPC 405 Core** beginning on [page 20](#), offers a summary of major PPC405 core features. For an in-depth discussion on both the Processor Block and PPC405, see the [PowerPC Processor Reference Guide](#) and the [PowerPC 405 Processor Block Reference Guide](#) available on the Xilinx website at <http://www.xilinx.com>.

### Processor Block Overview

**Figure 14** shows the internal architecture of the Processor Block.

**Figure 14: Processor Block Architecture**

Within the Virtex-II Pro Processor Block, there are four components:

- Embedded IBM PowerPC 405-D5 RISC CPU core
- On-Chip Memory (OCM) controllers and interfaces
- Clock/control interface logic
- CPU-FPGA Interfaces

### Embedded PowerPC 405 RISC Core

The PowerPC 405D5 core is a 0.13  $\mu\text{m}$  implementation of the IBM PowerPC 405D4 core. The advanced process technology enables the embedded PowerPC 405 (PPC405)

core to operate at 300+ MHz while maintaining low power consumption. Specially designed interface logic integrates the core with the surrounding CLBs, block RAMs, and general routing resources. Up to four Processor Blocks can be available in a single Virtex-II Pro device.

The embedded PPC405 core implements the PowerPC User Instruction Set Architecture (UISA), user-level registers, programming model, data types, and addressing modes for 32-bit fixed-point operations. 64-bit operations, auxiliary processor operations, and floating-point operations are trapped and can be emulated in software.

Most of the PPC405 core features are compatible with the specifications for the PowerPC Virtual Environment Architecture (VEA) and Operating Environment Architecture (OEA). They also provide a number of optimizations and extensions to the lower layers of the PowerPC Architecture. The full architecture of the PPC405 is defined by the PowerPC Embedded Environment and PowerPC UISA documentation, available from IBM.

### On-Chip Memory (OCM) Controllers

#### Introduction

The OCM controllers serve as dedicated interfaces between the block RAMs in the FPGA fabric (see [18 Kb Block SelectRAM+ Resources, page 44](#)) and OCM signals available on the embedded PPC405 core. The OCM signals on the PPC405 core are designed to provide very quick access to a fixed amount of instruction and data memory space. The OCM controller provides an interface to both the 64-bit Instruction-Side Block RAM (ISBRAM) and the 32-bit Data-Side Block RAM (DSBRAM). The designer can choose to implement:

- ISBRAM only
- DSBRAM only
- Both ISBRAM and DSBRAM
- No ISBRAM and no DSBRAM

One of OCM's primary advantages is that it guarantees a fixed latency of execution for a higher level of determinism. Additionally, it reduces cache pollution and thrashing, since the cache remains available for caching code from other memory resources.

Typical applications for DSOCM include scratch-pad memory, as well as use of the dual-port feature of block RAM to enable bidirectional data transfer between processor and FPGA. Typical applications for ISOCM include storage of interrupt service routines.

### Functional Features

#### Common Features

- Separate Instruction and Data memory interface between processor core and BRAMs in FPGA
- Dedicated interface to Device Control Register (DCR) bus for ISOCM and DSOCM

**Notes:**

1. Typical values are specified at nominal voltage, 25° C.
2. Quiescent current parameter values are specified for Commercial Grade. For Industrial Grade values, multiply Commercial Grade values by 1.5.
3. With no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
4. If DCI or differential signaling is used, more accurate quiescent current estimates can be obtained by using the Power Estimator or XPOWER™.

## Virtex-II Pro Pin-to-Pin Input Parameter Guidelines

All devices are 100% functionally tested. Listed below are representative values for typical pin locations and normal clock loading. Values are expressed in nanoseconds unless otherwise noted

**Notes:**

- Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
- These measurements include:
  - CLK0 and CLK180 DCM jitter
  - Worst-case duty-cycle distortion using CLK0 and CLK180,  $T_{DCD\_CLK180}$ .
- IFF = Input Flip-Flop or Latch

### FG256/FGG256 Fine-Pitch BGA Package

As shown in [Table 5](#), XC2VP2 and XC2VP4 Virtex-II Pro devices are available in the FG256/FGG256 fine-pitch BGA package. The pins in each of these devices are identical. Following this table are the [FG256/FGG256 Fine-Pitch BGA Package Specifications \(1.00mm pitch\)](#).
