Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (°C/W)

T_B = board temperature (°C)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and vias attaching the thermal balls to the ground plane.

7.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two resistor model can be used with the thermal simulation of the application [2], or a more accurate and complex model of the package can be used in the thermal simulation.

7.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

The thermal characterization parameter is measured per JESD51-2 specification published by JEDEC using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

Table 7 provides the bus operation timing for the MPC862/857T/857DSL at 33 MHz, 40 Mhz, 50 MHz and 66 Mhz.

The timing for the MPC862/857T/857DSL bus shown assumes a 50-pF load for maximum delays and a 0-pF load for minimum delays.

15 Document Revision History

Table 36 lists significant changes between revisions of this document.

Table 36. Document Revision History

Rev. No.	Date	Substantive Changes
0	2001	Initial revision
0.1	9/2001	Change extended temperature from 95 to 105
0.2	11/2001	Revised for new template, changed Table 7 B23 max value @ 66 MHz from 2 ns to 8 ns.
0.3	4/2002	• Timing modified and equations added, for Rev. A and B devices. • Modified power numbers and temperature ranges. Added ESAR UTOPIA timing.
1.0	9/2002	• Specification changed to include the MPC857T and MPC857DSL. • Changed maximum operating frequency from 80 MHz to 100 MHz. • Removed MPC862DP, DT, and SR derivatives and part numbers. • Corrected power dissipation numbers. • Changed UTOPIA maximum frequency from 50 MHz to 33 MHz. • Changed part number ordering information to Rev. B devices only. • To maximum ratings for temperature, added frequency ranges.
1.1	5/2003	Changed SPI Master Timing Specs. 162 and 164
1.2	8/2003	• Changed B28a through B28d and B29b to show that TRLX can be 0 or 1. • Non-technical reformatting
2.0	11/2004	• Added a table footnote to Table 5 DC Electrical Specifications about meeting the VIL Max of the I2C Standard. • Updated document template.
3.0	2/2006	• Changed Tj from 95C to 105C in table 34
