Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

The MPC862/857T/857DSL is comprised of three modules that each use the 32-bit internal bus: the MPC8xx core, the system integration unit (SIU), and the communication processor module (CPM). The MPC862P/862T block diagram is shown in Figure 1. The MPC857T/857DSL block diagram is shown in Figure 2.

7 Thermal Calculation and Measurement

For the following discussions, P_D= (VDD x IDD) + PI/O, where PI/O is the power dissipation of the I/O drivers.

7.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, in °C can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_A = ambient temperature (ºC)

$R_{\theta JA}$ = package junction-to-ambient thermal resistance (ºC/W)

P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value which provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity T_J-T_A) are possible.

[1] Phase and frequency jitter performance results are only valid if the input jitter is less than the prescribed value.

[2] If the rate of change of the frequency of EXTAL is slow (I.e. it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (I.e., it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

[3] The timings specified in B4 and B5 are based on full strength clock.

[4] The timing for $\overline{\text{BR}}$ output is relevant when the MPC862/857T/857DSL is selected to work with external bus arbiter. The timing for $\overline{\text{BG}}$ output is relevant when the MPC862/857T/857DSL is selected to work with internal bus arbiter.

[5] For part speeds above 50MHz, use 9.80ns for B11a.

[6] The timing required for $\overline{\text{BR}}$ input is relevant when the MPC862/857T/857DSL is selected to work with internal bus arbiter. The timing for $\overline{\text{BG}}$ input is relevant when the MPC862/857T/857DSL is selected to work with external bus arbiter.

[7] For part speeds above 50MHz, use 2ns for B17.

[8] The D(0:31) and DP(0:3) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the $\overline{\text{TA}}$ input signal is asserted.

[9] For part speeds above 50MHz, use 2ns for B19.

[10] The D(0:31) and DP(0:3) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

[11] The timing B30 refers to $\overline{\text{CS}}$ when ACS = 00 and to $\overline{\text{WE}}$(0:3) when CSNT = 0.

[12] The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in Figure 19.

[13] The $\overline{\text{AS}}$ signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in Figure 22.

88	L1CLK edge to L1SYNC valid (FSD = 00) CNT = 0000, BYT = 0, DSC = 0)	—	0.00	ns

1 The ratio SyncCLK/L1RCLK must be greater than 2.5/1.
2 These specs are valid for IDL mode only.
3 Where P = 1/CLKOUT. Thus for a 25-MHz CLKO1 rate, P = 40 ns.
4 These strobes and TxD on the first bit of the frame become valid after L1CLK edge or L1SYNC, whichever is later.

Table 22. Ethernet Timing (continued)

Num	Characteristic	All Frequencies		Unit
		Min	Max	
134	TENA inactive delay (from TCLK1 rising edge)	10	50	ns
135	$\overline{\text{RSTRT}}$ active delay (from TCLK1 falling edge)	10	50	ns
136	$\overline{\text{RSTRT}}$ inactive delay (from TCLK1 falling edge)	10	50	ns
137	$\overline{\text{REJECT}}$ width low	1	—	CLK
138	CLKO1 low to $\overline{\text{SDACK}}$ asserted [2]	—	20	ns
139	CLKO1 low to $\overline{\text{SDACK}}$ negated [2]	—	20	ns

[1] The ratios SyncCLK/RCLK1 and SyncCLK/TCLK1 must be greater or equal to 2/1.

[2] $\overline{\text{SDACK}}$ is asserted whenever the SDMA writes the incoming frame DA into memory.
