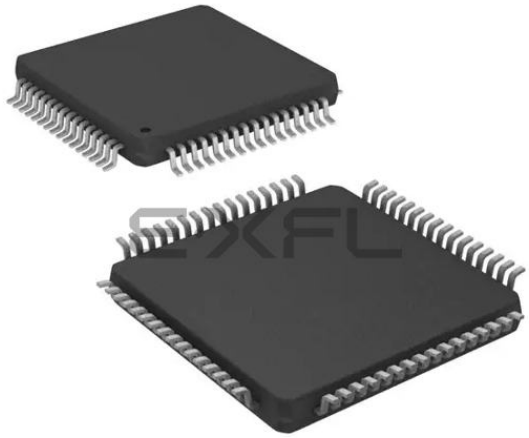
Microchip Technology - PIC24FJ128GA606-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

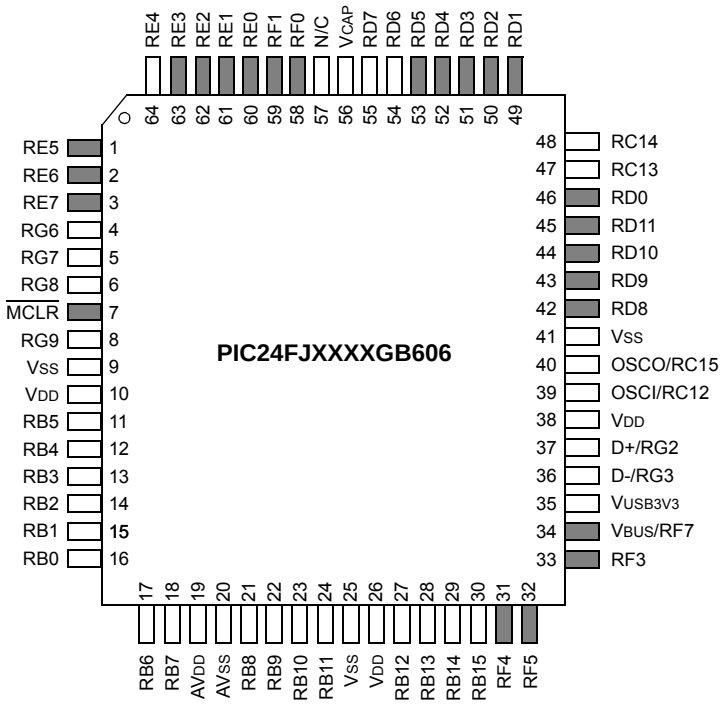
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, PMP, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, HLVD, POR, PWM, WDT
Number of I/O	53
Program Memory Size	128KB (43K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj128ga606-i-pt

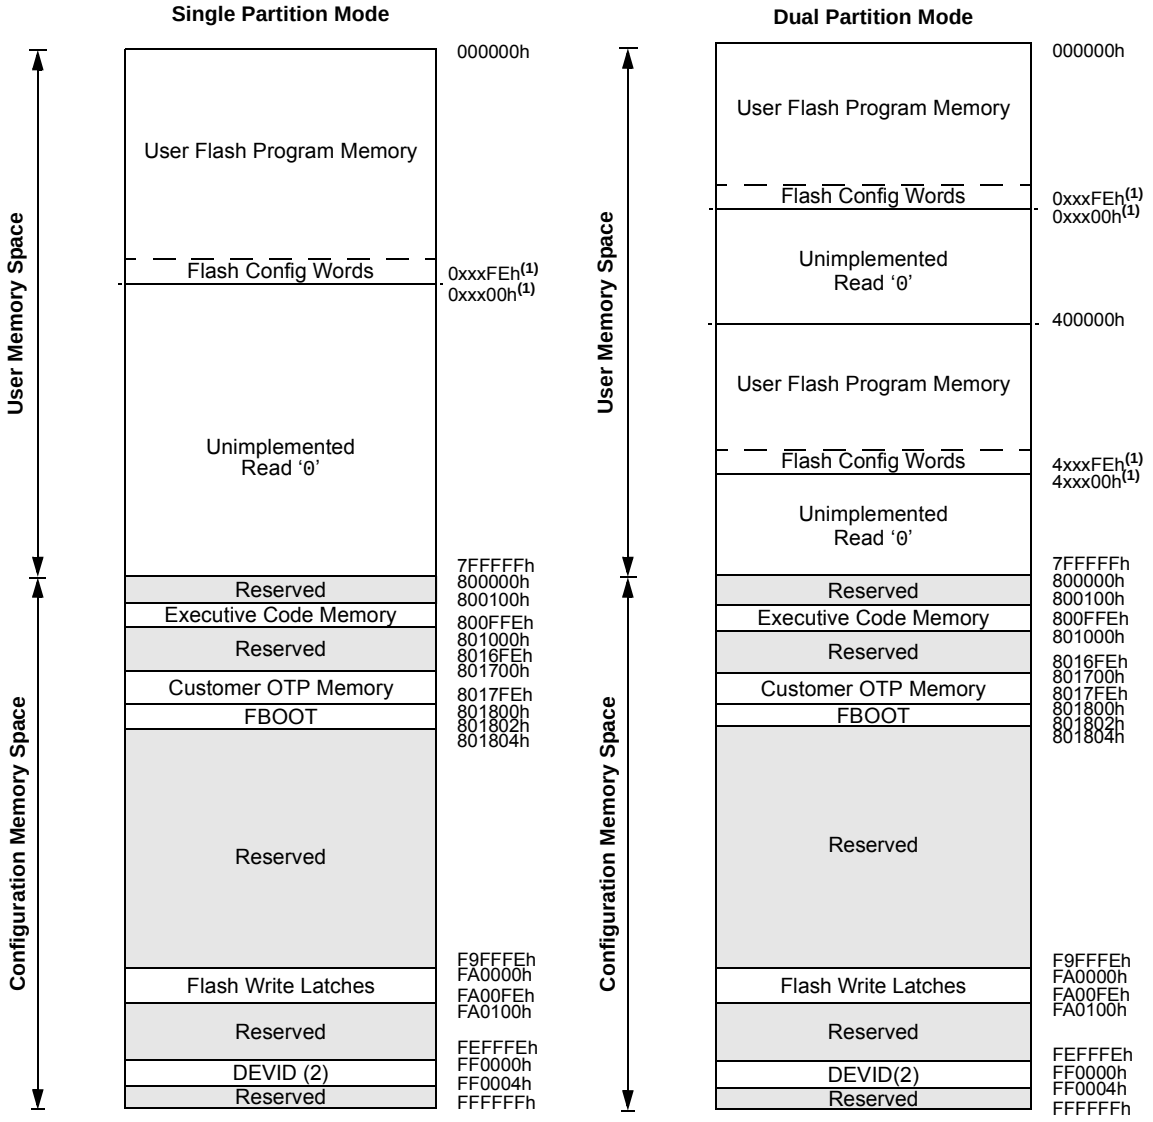
Pin Diagrams(2) (Continued)

64-Pin TQFP
64-Pin QFN(1)



Legend: See Table 3 for a complete description of pin functions. Pinouts are subject to change.
Note 1: It is recommended to connect the metal pad on the bottom of the 64-pin QFN package to VSS.
2: Gray shading indicates 5.5V tolerant input pins.

FIGURE 4-1: PROGRAM SPACE MEMORY MAP FOR PIC24FJ1024GA610/GB610 FAMILY DEVICES



Legend: Memory areas are not shown to scale.

Note 1: Exact boundary addresses are determined by the size of the implemented program memory (Table 4-1).

TABLE 4-1: PROGRAM MEMORY SIZES AND BOUNDARIES(1)

Device	Program Memory Upper Boundary (Instruction Words)			Write Blocks(2)	Erase Blocks(2)
	Single Partition Mode	Dual Partition Mode			
		Active Partition	Inactive Partition		
PIC24FJ1024GX6XX	0ABFFEh (352K)	055FFEh (176K)	455FFEh (176K)	2752	344
PIC24FJ512GX6XX	055FFEh (176K)	02AFFEh (88k)	42AFFEh (88k)	1376	172
PIC24FJ256GX6XX	02AFFEh (88K)	0157FEh (44k)	4157FEh (44k)	688	86
PIC24FJ128GX6XX	015FFEh (44K)	00AFFEh (22k)	40AFFEh (22k)	352	44

Note 1: Includes Flash Configuration Words.

2: 1 Write Block = 128 Instruction Words; 1 Erase Block = 1024 Instruction Words.

EXAMPLE 6-1: ERASING A PROGRAM MEMORY BLOCK ('C' LANGUAGE CODE)

```
// C example using MPLAB XC16
    unsigned long progAddr = 0xXXXXXX;          // Address of row to write
    unsigned int  offset;
//Set up pointer to the first memory location to be written
    NVMADRU = progAddr>>16;                     // Initialize PM Page Boundary SFR
    NVMADR = progAddr & 0xFFFF;                 // Initialize lower word of address
    NVMCON = 0x4003;                            // Initialize NVMCON
    asm("DISI #5");                             // Block all interrupts with priority <7
                                                // for next 5 instructions
    __builtin_write_NVM();                      // check function to perform unlock
                                                // sequence and set WR
```

EXAMPLE 6-2: INITIATING A PROGRAMMING SEQUENCE

```
        DISI    #5                      ; Block all interrupts with priority <7
                                        ; for next 5 instructions
        MOV.B   #0x55, W0
        MOV     W0, NVMKEY              ; Write the 0x55 key
        MOV.B   #0xAA, W1               ;
        MOV     W1, NVMKEY              ; Write the 0xAA key
        BSET    NVMCON, #WR             ; Start the programming sequence
        NOP                             ; Required delays
        NOP
        BTSC    NVMCON, #15             ; and wait for it to be
        BRA     $-2                     ; completed
```

16.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD<3:0> = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 16-1).

TABLE 16-1: TIMER OPERATION MODE

T32 (CCPxCON1L<5>)	Operating Mode
0	Dual Timer Mode (16-bit)
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses the CCPxTMRL and CCPxPRL registers. Only the primary timer can interact with other modules on the device. It generates the MCCPx Sync out signals for use by other MCCPx modules. It can also use the SYNC<4:0> bits signal generated by other modules.

The secondary timer uses the CCPxTMRH and CCPxPRH registers. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an output Sync/Trigger signal like the primary time base. In Dual Timer mode, the Secondary Timer Period register, CCPxPRH, generates the MCCPx Compare Event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L<5>) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

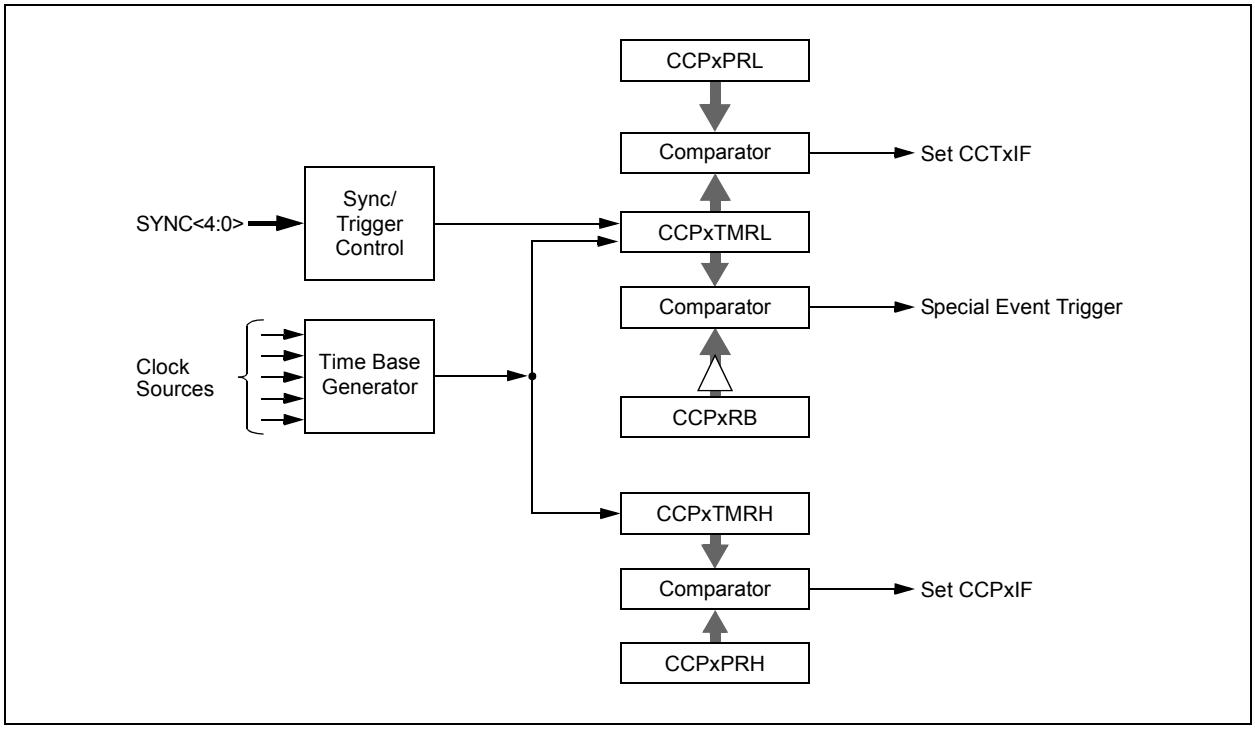
16.2.1 SYNC AND TRIGGER OPERATION

In both 16-bit and 32-bit modes, the timer can also function in either Synchronization (“Sync”) or Trigger mode operation. Both use the SYNC<4:0> bits (CCPxCON1H<4:0>) to determine the input signal source. The difference is how that signal affects the timer.

In Sync operation, the Timer Reset or clear occurs when the input selected by SYNC<4:0> is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H<7>) is cleared. The SYNC<4:0> bits can have any value except ‘11111’.

In Trigger operation, the timer is held in Reset until the input selected by SYNC<4:0> is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a Trigger event as long as the CCPTRIG bit (CCPxSTATL< 7>) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL<5>) must be set to clear the Trigger event, reset the timer and hold it at zero until another Trigger event occurs. On PIC24FJ1024GA610/GB610 family devices, Trigger operation can only be used when the system clock is the time base source (CLKSEL<2:0> = 000).

FIGURE 16-3: DUAL 16-BIT TIMER MODE



16.5 Auxiliary Output

The MCCPx and SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other MCCPx or SCCPx modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT<1:0> control bits (CCPxCON2H<4:3>). The type of output signal is also dependent on the module operating mode.

On the PIC24FJ1024GA610/GB610 family of devices, only the CTMU discharge Trigger has access to the auxiliary output signal.

TABLE 16-4: AUXILIARY OUTPUT

AUXOUT<1:0>	CCSEL	MOD<3:0>	Comments	Signal Description
00	x	xxxx	Auxiliary Output Disabled	No Output
01	0	0000	Time Base Modes	Time Base Period Reset or Rollover
10				Special Event Trigger Output

bit 15 **OETRIG:** CCPx Dead-Time Select bit
1 = For Triggered mode (TRIGEN = 1): Module does not drive enabled output pins until triggered
0 = Normal output pin operation

bit 14-12 **OSCNT<2:0>:** One-Shot Event Count bits
111 = Extends one-shot event by 7 time base periods (8 time base periods total)
110 = Extends one-shot event by 6 time base periods (7 time base periods total)
101 = Extends one-shot event by 5 time base periods (6 time base periods total)
100 = Extends one-shot event by 4 time base periods (5 time base periods total)
011 = Extends one-shot event by 3 time base periods (4 time base periods total)
010 = Extends one-shot event by 2 time base periods (3 time base periods total)
001 = Extends one-shot event by 1 time base period (2 time base periods total)
000 = Does not extend one-shot Trigger event

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **OUTM<2:0>:** PWMx Output Mode Control bits(1)
111 = Reserved
110 = Output Scan mode
101 = Brush DC Output mode, forward
100 = Brush DC Output mode, reverse
011 = Reserved
010 = Half-Bridge Output mode
001 = Push-Pull Output mode
000 = Steerable Single Output mode

bit 7-6 **Unimplemented:** Read as '0'

bit 5 **POLACE:** CCPx Output Pins, OCMxA, OCMxC and OCMxE, Polarity Control bit
1 = Output pin polarity is active-low
0 = Output pin polarity is active-high

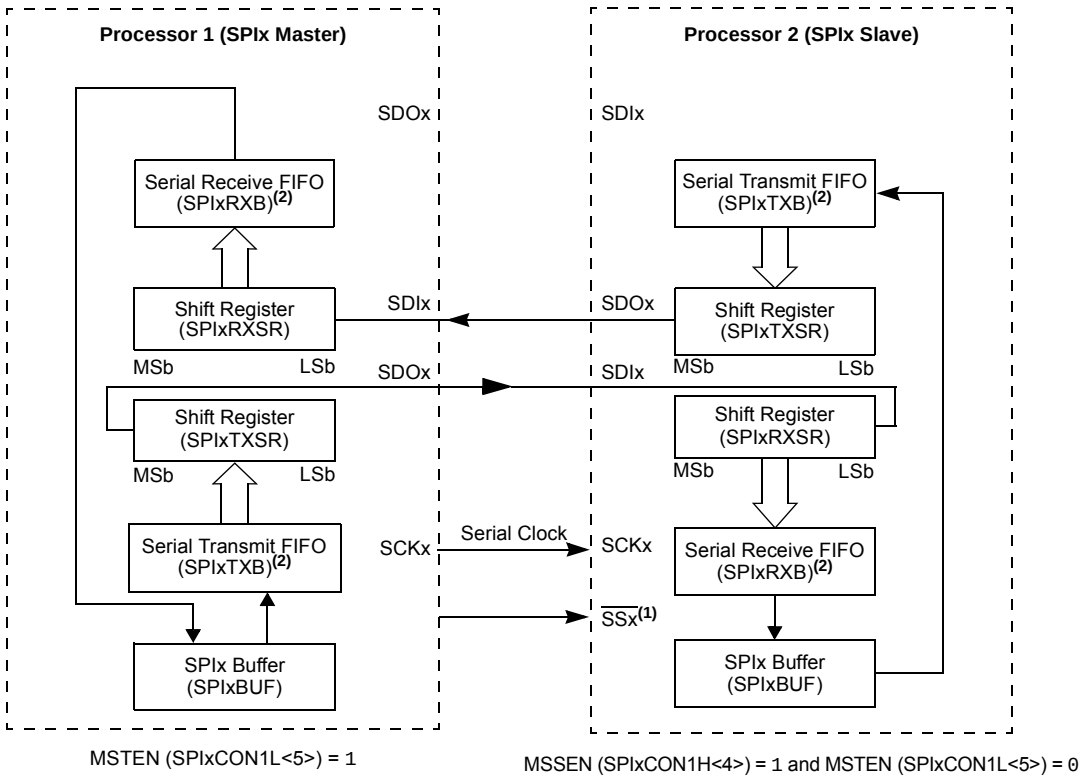
bit 4 **POLBDF:** CCPx Output Pins, OCMxB, OCMxD and OCMxF, Polarity Control bit(1)
1 = Output pin polarity is active-low
0 = Output pin polarity is active-high

bit 3-2 **PSSACE<1:0>:** PWMx Output Pins, OCMxA, OCMxC and OCMxE, Shutdown State Control bits
11 = Pins are driven active when a shutdown event occurs
10 = Pins are driven inactive when a shutdown event occurs
0x = Pins are tri-stated when a shutdown event occurs

bit 1-0 **PSSBDF<1:0>:** PWMx Output Pins, OCMxB, OCMxD, and OCMxF, Shutdown State Control bits(1)
11 = Pins are driven active when a shutdown event occurs
10 = Pins are driven inactive when a shutdown event occurs
0x = Pins are in a high-impedance state when a shutdown event occurs

Note 1: These bits are implemented in MCCPx modules only.

FIGURE 17-3: SPIx MASTER/SLAVE CONNECTION (ENHANCED BUFFER MODES)



Note 1: Using the $\overline{SSx}$ pin in Slave mode of operation is optional.

2: User must write transmit data to read the received data from SPIxBUF. The SPIxTXB and SPIxRXB registers are memory-mapped to SPIxBUF.

bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-7 **Unimplemented:** Read as '0'

bit 6 **PCIE:** Stop Condition Interrupt Enable bit (I^2C Slave mode only)
1 = Enables interrupt on detection of Stop condition
0 = Stop detection interrupts are disabled

bit 5 **SCIE:** Start Condition Interrupt Enable bit (I^2C Slave mode only)
1 = Enables interrupt on detection of Start or Restart conditions
0 = Start detection interrupts are disabled

bit 4 **BOEN:** Buffer Overwrite Enable bit (I^2C Slave mode only)
1 = I2CxRCV is updated and an ACK is generated for a received address/data byte, ignoring the state of the I2COV bit only if RBF bit = 0
0 = I2CxRCV is only updated when I2COV is clear

bit 3 **SDAHT:** SDAx Hold Time Selection bit(1)
1 = Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
0 = Minimum of 100 ns hold time on SDAx after the falling edge of SCLx

bit 2 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I^2C Slave mode only)
If, on the rising edge of SCLx, SDAx is sampled low when the module is outputting a high state, the BCL bit is set and the bus goes Idle. This Detection mode is only valid during data and ACK transmit sequences.
1 = Enables slave bus collision interrupts
0 = Slave bus collision interrupts are disabled

bit 1 **AHEN:** Address Hold Enable bit (I^2C Slave mode only)
1 = Following the 8th falling edge of SCLx for a matching received address byte; SCLREL bit (I2CxCONL<12>) will be cleared and SCLx will be held low
0 = Address holding is disabled

bit 0 **DHEN:** Data Hold Enable bit (I^2C Slave mode only)
1 = Following the 8th falling edge of SCLx for a received data byte; slave hardware clears the SCLREL bit (I2CxCONL<12>) and SCLx is held low
0 = Data holding is disabled

Note 1: This bit must be set to '0' for 1 MHz operation.

20.2 USB Buffer Descriptors and the BDT

Endpoint buffer control is handled through a structure called the Buffer Descriptor Table (BDT). This provides a flexible method for users to construct and control endpoint buffers of various lengths and configurations.

The BDT can be located in any available 512-byte, aligned block of data RAM. The BDT Pointer (U1BDTP1) contains the upper address byte of the BDT and sets the location of the BDT in RAM. The user must set this pointer to indicate the table's location.

The BDT is composed of Buffer Descriptors (BDs) which are used to define and control the actual buffers in the USB RAM space. Each BD consists of two 16-bit, "soft" (non-fixed-address) registers, BDnSTAT and BDnADR, where n represents one of the 64 possible BDs (range of 0 to 63). BDnSTAT is the status register for BDn, while BDnADR specifies the starting address for the buffer associated with BDn.

Note: Since BDnADR is a 16-bit register, only the first 64 Kbytes of RAM can be accessed by the USB module.

Depending on the endpoint buffering configuration used, there are up to 64 sets of Buffer Descriptors, for a total of 256 bytes. At a minimum, the BDT must be at least 8 bytes long. This is because the *"USB 2.0 Specification"* mandates that every device must have Endpoint 0 with both input and output for initial setup.

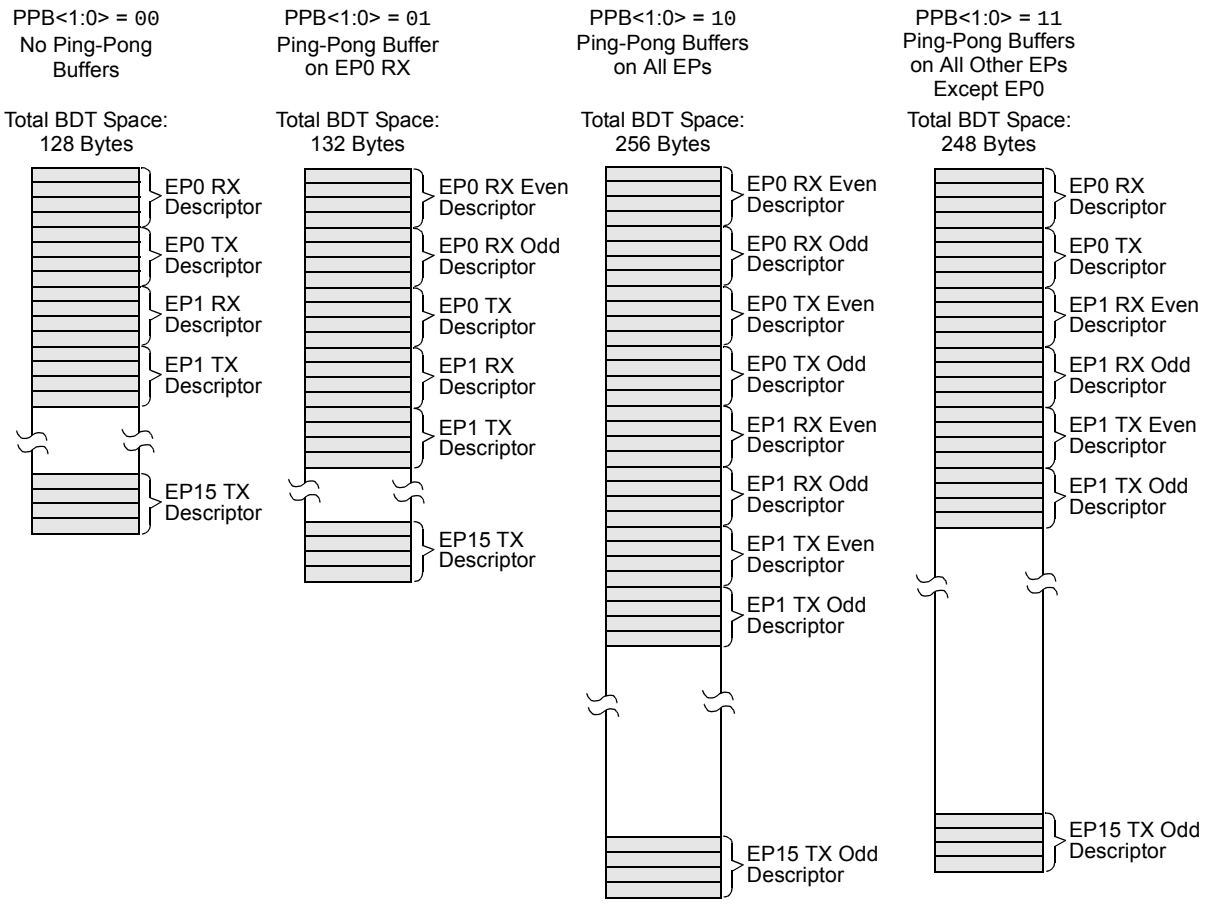
Endpoint mapping in the BDT is dependent on three variables:

- Endpoint number (0 to 15)
- Endpoint direction (RX or TX)
- Ping-pong settings (U1CNFG1<1:0>)

Figure 20-7 illustrates how these variables are used to map endpoints in the BDT.

In Host mode, only Endpoint 0 Buffer Descriptors are used. All transfers utilize the Endpoint 0 Buffer Descriptor and Endpoint Control register (U1EP0). For received packets, the attached device's source endpoint is indicated by the value of ENDPT<3:0> in the USB Status register (U1STAT<7:4>). For transmitted packets, the attached device's destination endpoint is indicated by the value written to the USB Token register (U1TOK).

FIGURE 20-7: BDT MAPPING FOR ENDPOINT BUFFERING MODES



Note: Memory area is not shown to scale.

bit 15-3 **Unimplemented:** Read as '0'

bit 2-0 **DMABL<2:0>:** DMA Buffer Size Select bits(1)

111 = Allocates 128 words of buffer to each analog input
110 = Allocates 64 words of buffer to each analog input
101 = Allocates 32 words of buffer to each analog input
100 = Allocates 16 words of buffer to each analog input
011 = Allocates 8 words of buffer to each analog input
010 = Allocates 4 words of buffer to each analog input
001 = Allocates 2 words of buffer to each analog input
000 = Allocates 1 word of buffer to each analog input

Note 1: The DMABL<2:0> bits are only used when AD1CON1<11> = 1 and AD1CON1<12> = 0; otherwise, their value is ignored.

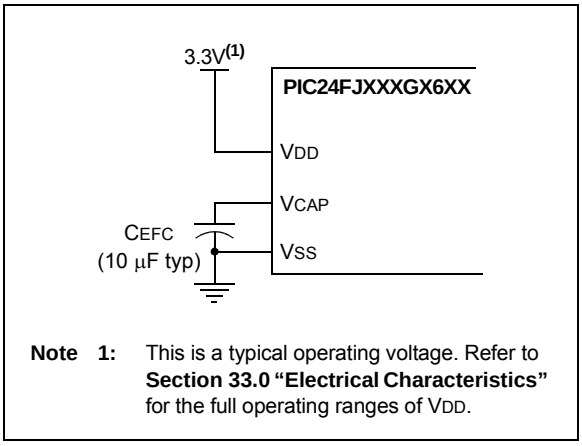
30.3 On-Chip Voltage Regulator

All PIC24FJ1024GA610/GB610 family devices power their core digital logic at a nominal 1.8V. This may create an issue for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the PIC24FJ1024GA610/GB610 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

This regulator is always enabled. It provides a constant voltage (1.8V nominal) to the digital core logic, from a VDD of about 2.1V, all the way up to the device's VDDMAX. It does not have the capability to boost VDD levels. In order to prevent "brown-out" conditions when the voltage drops too low for the regulator, the Brown-out Reset occurs. Then, the regulator output follows VDD with a typical voltage drop of 300 mV.

A low-ESR capacitor (such as ceramic) must be connected to the VCAP pin (Figure 30-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor (CEFC) is provided in **Section 33.1 "DC Characteristics"**.

FIGURE 30-1: CONNECTIONS FOR THE ON-CHIP REGULATOR



Note 1: This is a typical operating voltage. Refer to **Section 33.0 "Electrical Characteristics"** for the full operating ranges of VDD.

30.3.1 ON-CHIP REGULATOR AND POR

The voltage regulator takes approximately 10 μs for it to generate output. During this time, designated as TVREG, code execution is disabled. TVREG is applied every time the device resumes operation after any power-down, including Sleep mode. TVREG is determined by the status of the VREGS bit (RCON<8>) and the WDTWIN<1:0> Configuration bits (FWDT<9:8>). Refer to **Section 33.0 "Electrical Characteristics"** for more information on TVREG.

Note:	For more information, see **Section 33.0 "Electrical Characteristics"**. The information in this data sheet supersedes the information in the FRM.

30.3.2 VOLTAGE REGULATOR STANDBY MODE

The on-chip regulator always consumes a small incremental amount of current over IDD/IPD, including when the device is in Sleep mode, even though the core digital logic does not require power. To provide additional savings in applications where power resources are critical, the regulator can be made to enter Standby mode on its own whenever the device goes into Sleep mode. This feature is controlled by the VREGS bit (RCON<8>). Clearing the VREGS bit enables the Standby mode. When waking up from Standby mode, the regulator needs to wait for TVREG to expire before wake-up.

30.3.3 LOW-VOLTAGE/RETENTION REGULATOR

When in Sleep mode, PIC24FJ1024GA610/GB610 family devices may use a separate low-power, low-voltage/retention regulator to power critical circuits. This regulator, which operates at 1.2V nominal, maintains power to data RAM and the RTCC while all other core digital logic is powered down. The low-voltage/retention regulator is described in more detail in **Section 10.2.4 "Low-Voltage Retention Regulator"**.

TABLE 33-26: A/D CONVERSION TIMING REQUIREMENTS(1)

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min.	Typ	Max.	Units	Conditions
Clock Parameters							
AD50	TAD	A/D Clock Period	278		—	ns	
AD51	tRC	A/D Internal RC Oscillator Period	—	250	—	ns	
Conversion Rate							
AD55	tCONV	SAR Conversion Time, 12-Bit Mode	—	14	—	TAD	
AD55A		SAR Conversion Time, 10-Bit Mode	—	12	—	TAD	
AD56	FCNV	Throughput Rate	—		200	ksps	AVDD > 2.7V(2)
AD57	tSAMP	Sample Time	—	1	—	TAD	**(Note 1)**
Clock Synchronization							
AD61	tPSS	Sample Start Delay from Setting Sample bit (SAMP)	1.5	—	2.5	TAD	

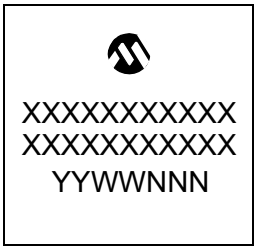
Note 1: Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

2: Throughput rate is based on AD55 + AD57 + AD61 and the period of TAD.

34.0 PACKAGING INFORMATION

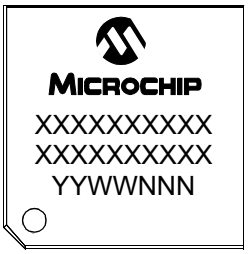
34.1 Package Marking Information

64-Lead QFN (9x9x0.9 mm)

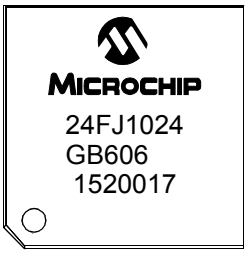


Example

64-Lead TQFP (10x10x1 mm)



Example



Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:
