

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

E·XFI

Product Status	Not For New Designs
Core Processor	Н8/300Н
Core Size	16-Bit
Speed	20MHz
Connectivity	SCI
Peripherals	PWM, WDT
Number of I/O	30
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 4x10b
Oscillator Type	Internal
Operating Temperature	-20°C ~ 75°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LFQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/df36024fpv

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

2.2.1 General Registers

The H8/300H CPU has eight 32-bit general registers. These general registers are all functionally identical and can be used as both address registers and data registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. Figure 2.3 illustrates the usage of the general registers. When the general registers are used as 32-bit registers or address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum of sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum of sixteen 8-bit registers.

The usage of each register can be selected independently.

Figure 2.3 Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.4 shows the stack.

Figure 2.5 General Register Data Formats (2)

Section 3 Exception Handling

Exception handling may be caused by a reset, a trap instruction (TRAPA), or interrupts.

• Reset

A reset has the highest exception priority. Exception handling starts as soon as the reset is cleared by the $\overline{\text{RES}}$ pin. The chip is also reset when the watchdog timer overflows, and exception handling starts. Exception handling is the same as exception handling by the $\overline{\text{RES}}$ pin.

Trap Instruction

Exception handling starts when a trap instruction (TRAPA) is executed. The TRAPA instruction generates a vector address corresponding to a vector number from 0 to 3, as specified in the instruction code. Exception handling can be executed at all times in the program execution state.

• Interrupts

External interrupts other than NMI and internal interrupts other than address break are masked by the I bit in CCR, and kept masked while the I bit is set to 1. Exception handling starts when the current instruction or exception handling ends, if an interrupt request has been issued.

3.1 Exception Sources and Vector Address

Table 3.1 shows the vector addresses and priority of each exception handling. When more than one interrupt is requested, handling is performed from the interrupt with the highest priority.

Relative Module	Exception Sources	Vector Number	Vector Address	Priority		
RES pin Watchdog timer	Reset	0	H'0000 to H'0001	High		
—	Reserved for system use	1 to 6	H'0002 to H'000D	-		
External interrupt pin	NMI	7	H'000E to H'000F			
CPU	Trap instruction (#0)	8	H'0010 to H'0011	-		
	(#1)	9	H'0012 to H'0013			
	(#2)	10	H'0014 to H'0015			
	(#3)	11	H'0016 to H'0017	- -		
Address break	Break conditions satisfied	12	H'0018 to H'0019	Low		

5.3.2 Notes on Board Design

When using a crystal resonator (ceramic resonator), place the resonator and its load capacitors as close as possible to the OSC_1 and OSC_2 pins. Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation (see figure 5.7).

Figure 5.7 Example of Incorrect Board Design

		Initial		
Bit	Bit Name	Value	R/W	Description
0	WKP0	0	R/W	P50/WKP0 Pin Function Switch
				Selects whether pin P50/ $\overline{WKP0}$ is used as P50 or as $\overline{WKP0}$.
				0: General I/O port
				1: WKP0 input pin

9.3.2 Port Control Register 5 (PCR5)

PCR5 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 5.

Bit	Bit Name	Initial Value	R/W	Description
7	PCR57	0	W	When each of the port 5 pins P57 to P50 functions as an
6	PCR56	0	W	general I/O port, setting a PCR5 bit to 1 makes the
5	PCR55	0	W	makes the pin an input port.
4	PCR54	0	W	
3	PCR53	0	W	
2	PCR52	0	W	
1	PCR51	0	W	
0	PCR50	0	W	

• P50/WKP0 pin

Register	PMR5	PCR5	
Bit Name	WKP0	PCR50	Pin Function
Setting Value	0	0	P50 input pin
		1	P50 output pin
	1	Х	WKP0 input pin

Legend X: Don't care.

9.4 Port 7

Port 7 is a general I/O port also functioning as a timer V I/O pin. Each pin of the port 7 is shown in figure 9.4. The register setting of TCSRV in timer V has priority for functions of pin P76/TMOV. The pins, P75/TMCIV and P74/TMRIV, are also functioning as timer V input ports that are connected to the timer V regardless of the register setting of port 7.

Port 7 has the following registers.

- Port control register 7 (PCR7)
- Port data register 7 (PDR7)

10.3.2 Time Constant Registers A and B (TCORA, TCORB)

TCORA and TCORB have the same function.

TCORA and TCORB are 8-bit read/write registers.

TCORA and TCNTV are compared at all times. When the TCORA and TCNTV contents match, CMFA is set to 1 in TCSRV. If CMIEA is also set to 1 in TCRV0, a CPU interrupt is requested. Note that they must not be compared during the T3 state of a TCORA write cycle.

Timer output from the TMOV pin can be controlled by the identifying signal (compare match A) and the settings of bits OS3 to OS0 in TCSRV.

TCORA and TCORB are initialized to H'FF.

Bit	Bit Name	Initial Value	R/W	Description
1	IOA1	0	R/W	I/O Control A1 and A0
0	IOA0	0	R/W	When $IOA2 = 0$,
				00: No output at compare match
				01: 0 output to the FTIOA pin at GRA compare match
				10: 1 output to the FTIOA pin at GRA compare match
				11: Output toggles to the FTIOA pin at GRA compare match
				When IOA2 = 1,
				00: Input capture at rising edge of the FTIOA pin
				01: Input capture at falling edge of the FTIOA pin
				1X: Input capture at rising and falling edges of the FTIOA pin

Legend X: Don't care.

11.3.6 Timer I/O Control Register 1 (TIOR1)

TIOR1 selects the functions of GRC and GRD, and specifies the functions of the FTIOC and FTIOD pins.

Bit	Bit Name	Initial Value	R/W	Description
7	_	1	_	Reserved
				This bit is always read as 1.
6	IOD2	0	R/W	I/O Control D2
				Selects the GRD function.
				0: GRD functions as an output compare register
				1: GRD functions as an input capture register

Bit	Bit Name	Initial Value	R/W	Description
3	MPIE	0	R/W	Multiprocessor Interrupt Enable (enabled only when the MP bit in SMR is 1 in asynchronous mode)
				When this bit is set to 1, receive data in which the multiprocessor bit is 0 is skipped, and setting of the RDRF, FER, and OER status flags in SSR is disabled. On receiving data in which the multiprocessor bit is 1, this bit is automatically cleared and normal reception is resumed. For details, refer to section 13.6, Multiprocessor Communication Function.
2	TEIE	0	R/W	Transmit End Interrupt Enable
				When this bit is set to 1, TEI interrupt request is enabled.
1	CKE1	0	R/W	Clock Enable 0 and 1
0	CKE0	0	R/W	Selects the clock source.
				Asynchronous mode
				00: On-chip baud rate generator
				01: On-chip baud rate generator
				Outputs a clock of the same frequency as the bit rate from the SCK3 pin.
				10: External clock
				Inputs a clock with a frequency 16 times the bit rate from the SCK3 pin.
				11:Reserved
				Clocked synchronous mode
				00: On-chip clock (SCK3 pin functions as clock output)
				01:Reserved
				10: External clock (SCK3 pin functions as clock input)
				11:Reserved

13.8 Usage Notes

13.8.1 Break Detection and Processing

When framing error detection is performed, a break can be detected by reading the RXD pin value directly. In a break, the input from the RXD pin becomes all 0s, setting the FER flag, and possibly the PER flag. Note that as the SCI3 continues the receive operation after receiving a break, even if the FER flag is cleared to 0, it will be set to 1 again.

13.8.2 Mark State and Break Sending

When TE is 0, the TXD pin is used as an I/O port whose direction (input or output) and level are determined by PCR and PDR. This can be used to set the TXD pin to mark state (high level) or send a break during serial data transmission. To maintain the communication line at mark state until TE is set to 1, set both PCR and PDR to 1. As TE is cleared to 0 at this point, the TXD pin becomes an I/O port, and 1 is output from the TXD pin. To send a break during serial transmission, first set PCR to 1 and clear PDR to 0, and then clear TE to 0. When TE is cleared to 0, the transmitter is initialized regardless of the current transmission state, the TXD pin becomes an I/O port, and 0 is output from the TXD pin.

13.8.3 Receive Error Flags and Transmit Operations (Clocked Synchronous Mode Only)

Transmission cannot be started when a receive error flag (OER, PER, or FER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note also that receive error flags cannot be cleared to 0 even if the RE bit is cleared to 0.

(3) Procedures for Clearing Settings when Using LVDR and LVDI

To operate or release the low-voltage detection circuit normally, follow the procedure described below. Figure 15.5 shows the timing for the operation and release of the low-voltage detection circuit.

- 1. To operate the low-voltage detection circuit, set the LVDE bit in LVDCR to 1.
- 2. Wait for 50 μ s (t_{LVDON}) until the reference voltage and the low-voltage-detection power supply have stabilized by a software timer, etc. Then, clear the LVDDF and LVDUF bits in LVDSR to 0 and set the LVDRE, LVDDE, and LVDUE bits in LVDCR to 1, as required.
- 3. To release the low-voltage detection circuit, start by clearing all of the LVDRE, LVDDE, and LVDUE bits to 0. Then clear the LVDE bit to 0. The LVDE bit must not be cleared to 0 at the same timing as the LVDRE, LVDDE, and LVDUE bits because incorrect operation may occur.

Figure 15.5 Timing for Operation/Release of Low-Voltage Detection Circuit

		Values						
Item	Symbol	Applicable Pins	Test Condition	Min	Тур	Max	Unit	Notes
RAM data retaining voltage	V_{RAM}	V _{cc}		2.0	_	_	V	

Notes: 1. The SCK3_3 and RXD_3 pins are not available in the H8/36014.

2. Pin states during current consumption measurement are given below (excluding current in the pull-up MOS transistors and output buffers).

Mode	RES Pin	Internal State	Other Pins	Oscillator Pins		
Active mode 1	V _{cc}	Operates	V _{cc}	Main clock:		
Active mode 2	_	Operates (¢OSC/64)		ceramic or crystal resonator		
Sleep mode 1 V _{cc}		Only timers operate	V _{cc}			
Sleep mode 2	_	Only timers operate (¢OSC/64)				
Standby mode	V _{cc}	CPU and timers both stop	V _{cc}	Main clock: ceramic or crystal resonator
