
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	CANbus, I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, Motor Control PWM, POR, PWM, QEI, WDT
Number of I/O	53
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 16x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj128mc706a-e-pt

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

8.0 DIRECT MEMORY ACCESS (DMA)

Note 1: This data sheet summarizes the features of the dsPIC33FJXXXMCX06A/X08A/X10A family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. “Direct Memory Access (DMA)”** (DS70182) in the *“dsPIC33F/PIC24H Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

Direct Memory Access (DMA) is a very efficient mechanism of copying data between peripheral SFRs (e.g., the UART Receive register and Input Capture 1 buffer) and buffers or variables stored in RAM, with minimal CPU intervention. The DMA controller can automatically copy entire blocks of data without requiring the user software to read or write the peripheral Special Function Registers (SFRs) every time a peripheral interrupt occurs. The DMA controller uses a dedicated bus for data transfers, and therefore, does not steal cycles from the code execution flow of the CPU. To exploit the DMA capability, the corresponding user buffers or variables must be located in DMA RAM.

The dsPIC33FJXXXMCX06A/X08A/X10A peripherals that can utilize DMA are listed in Table 8-1 along with their associated Interrupt Request (IRQ) numbers.

TABLE 8-1: PERIPHERALS WITH DMA SUPPORT

Peripheral	IRQ Number
INT0	0
Input Capture 1	1
Input Capture 2	5
Output Compare 1	2
Output Compare 2	6
Timer2	7
Timer3	8
SPI1	10
SPI2	33
UART1 Reception	11
UART1 Transmission	12
UART2 Reception	30
UART2 Transmission	31
ADC1	13
ADC2	21
ECAN1 Reception	34
ECAN1 Transmission	70
ECAN2 Reception	55
ECAN2 Transmission	71

The DMA controller features eight identical data transfer channels. Each channel has its own set of control and status registers. Each DMA channel can be configured to copy data, either from buffers stored in dual port DMA RAM to peripheral SFRs, or from peripheral SFRs to buffers in DMA RAM.

The DMA controller supports the following features:

- Word or byte-sized data transfers.
- Transfers from peripheral to DMA RAM or DMA RAM to peripheral.
- Indirect Addressing of DMA RAM locations with or without automatic post-increment.
- Peripheral Indirect Addressing – In some peripherals, the DMA RAM read/write addresses may be partially derived from the peripheral.
- One-Shot Block Transfers – Terminating DMA transfer after one block transfer.
- Continuous Block Transfers – Reloading DMA RAM buffer start address after every block transfer is complete.
- Ping-Pong Mode – Switching between two DMA RAM start addresses between successive block transfers, thereby filling two buffers alternately.
- Automatic or manual initiation of block transfers.
- Each channel can select from 20 possible sources of data sources or destinations.

For each DMA channel, a DMA interrupt request is generated when a block transfer is complete. Alternatively, an interrupt can be generated when half of the block has been filled.

19.0 INTER-INTEGRATED CIRCUIT (I^2C™)

Note 1: This data sheet summarizes the features of the dsPIC33FJXXXMCX06A/X08A/X10A family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Inter-Integrated Circuit (I^2C™)"** (DS70195) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit (I^2C) module, with its 16-bit interface, provides complete hardware support for both Slave and Multi-Master modes of the I^2C serial communication standard.

The dsPIC33FJXXXMCX06A/X08A/X10A devices have up to two I^2C interface modules, denoted as I2C1 and I2C2. Each I^2C module has a 2-pin interface: the SCLx pin is clock and the SDAx pin is data.

Each I^2C module 'x' (x = 1 or 2) offers the following key features:

- I^2C interface supports both master and slave operation
- I^2C Slave mode supports 7-bit and 10-bit addressing
- I^2C Master mode supports 7 and 10-bit addressing
- I^2C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I^2C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I^2C supports multi-master operation; it detects bus collision and will arbitrate accordingly

19.1 Operating Modes

The hardware fully implements all the master and slave functions of the I^2C Standard and Fast mode specifications, as well as 7 and 10-bit addressing.

The I^2C module can operate either as a slave or a master on an I^2C bus.

The following types of I^2C operation are supported:

- I^2C slave operation with 7-bit addressing
- I^2C slave operation with 10-bit addressing
- I^2C master operation with 7-bit or 10-bit addressing

For details about the communication sequence in each of these modes, please refer to the "*dsPIC33F/PIC24H Family Reference Manual*".

REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 4	**P:** Stop bit 1 = Indicates that a Stop bit has been detected last 0 = Stop bit was not detected last Hardware set or clear when Start, Repeated Start or Stop detected.
bit 3	**S:** Start bit 1 = Indicates that a Start (or Repeated Start) bit has been detected last 0 = Start bit was not detected last Hardware set or clear when Start, Repeated Start or Stop detected.
bit 2	**R_W:** Read/Write Information bit (when operating as I^2C slave) 1 = Read – indicates data transfer is output from slave 0 = Write – indicates data transfer is input to slave Hardware set or clear after reception of I^2C device address byte.
bit 1	**RBF:** Receive Buffer Full Status bit 1 = Receive complete; I2CxRCV is full 0 = Receive not complete; I2CxRCV is empty Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.
bit 0	**TBF:** Transmit Buffer Full Status bit 1 = Transmit in progress, I2CxTRN is full 0 = Transmit complete, I2CxTRN is empty Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

© 2009-2012 Microchip Technology Inc.

REGISTER 20-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

bit 4	**URXINV:** Receive Polarity Inversion bit 1 = UxRX Idle state is '0' 0 = UxRX Idle state is '1'
bit 3	**BRGH:** High Baud Rate Enable bit 1 = BRG generates 4 clocks per bit period (4x baud clock, High-Speed mode) 0 = BRG generates 16 clocks per bit period (16x baud clock, Standard mode)
bit 2-1	**PDSEL<1:0>:** Parity and Data Selection bits 11 = 9-bit data, no parity 10 = 8-bit data, odd parity 01 = 8-bit data, even parity 00 = 8-bit data, no parity
bit 0	**STSEL:** Stop Bit Selection bit 1 = Two Stop bits 0 = One Stop bit

Note 1: Refer to **Section 17. "UART"** (DS70188) in the *"dsPIC33F/PIC24H Family Reference Manual"* for information on enabling the UART module for receive or transmit operation.

2: This feature is only available for the 16x BRG mode (BRGH = 0).

 © 2009-2012 Microchip Technology Inc.

REGISTER 20-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

bit 7-6 **URXISEL<1:0>:** Receive Interrupt Mode Selection bits

- 11 = Interrupt is set on the UxRSR transfer, making the receive buffer full (i.e., has 4 data characters)
- 10 = Interrupt is set on the UxRSR transfer, making the receive buffer 3/4 full (i.e., has 3 data characters)
- 0x = Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer. Receive buffer has one or more characters

bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)

- 1 = Address Detect mode enabled. If 9-bit mode is not selected, this does not take effect.
- 0 = Address Detect mode disabled

bit 4 **RIDLE:** Receiver Idle bit (read-only)

- 1 = Receiver is Idle
- 0 = Receiver is active

bit 3 **PERR:** Parity Error Status bit (read-only)

- 1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
- 0 = Parity error has not been detected

bit 2 **FERR:** Framing Error Status bit (read-only)

- 1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
- 0 = Framing error has not been detected

bit 1 **OERR:** Receive Buffer Overrun Error Status bit (read/clear only)

- 1 = Receive buffer has overflowed
- 0 = Receive buffer has not overflowed. Clearing a previously set OERR bit (1 $\rightarrow$ 0 transition) will reset the receiver buffer and the UxRSR to the empty state.

bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)

- 1 = Receive buffer has data, at least one more character can be read
- 0 = Receive buffer is empty

Note 1: Refer to **Section 17. "UART"** (DS70188) in the *"dsPIC33F/PIC24H Family Reference Manual"* for information on enabling the UART module for transmit operation.

23.5 JTAG Interface

dsPIC33FJXXXMCX06A/X08A/X10A devices implement a JTAG interface, which supports boundary scan device testing, as well as in-circuit programming. Detailed information on the interface will be provided in future revisions of the document.

23.6 Code Protection and CodeGuard™ Security

The dsPIC33FJXXXMCX06A/X08A/X10A devices offer the advanced implementation of CodeGuard™ Security. CodeGuard Security enables multiple parties to securely share resources (memory, interrupts and peripherals) on a single chip. This feature helps protect individual Intellectual Property (IP) in collaborative system designs.

When coupled with software encryption libraries, CodeGuard™ Security can be used to securely update Flash even when multiple IPs are resident on the single chip. The code protection features vary depending on the actual device implemented. The following sections provide an overview of these features.

The code protection features are controlled by the Configuration registers: FBS, FSS and FGS.

Note:	Refer to **Section 23. "CodeGuard™ Security"** (DS70199) in the *"dsPIC33F/PIC24H Family Reference Manual"* for further information on usage, configuration and operation of CodeGuard Security.

23.7 In-Circuit Serial Programming

dsPIC33FJXXXMCX06A/X08A/X10A family digital signal controllers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground and the programming sequence. This allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. This also allows the most recent firmware, or a custom firmware, to be programmed. Please refer to the "*dsPIC33F/PIC24H Flash Programming Specification"* (DS70152) document for details about ICSP.

Any one out of three pairs of programming clock/data pins may be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

23.8 In-Circuit Debugger

When MPLAB® ICD 2 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any one out of three pairs of debugging clock/data pins may be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to $\overline{MCLR}$, V_{DD}, V_{SS} and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

Device Supply							
AD01	AVDD	Module VDD Supply	Greater of VDD – 0.3 or 3.0	—	Lesser of VDD + 0.3 or 3.6	V	—
AD02	AVSS	Module VSS Supply	VSS – 0.3	—	VSS + 0.3	V	—
Reference Inputs							
AD05	VREFH	Reference Voltage High	AVSS + 2.5	—	AVDD	V	—
AD05a			3.0	—	3.6	V	VREFH = AVDD VREFL = AVSS = 0
AD06	VREFL	Reference Voltage Low	AVSS	—	AVDD – 2.5	V	—
AD06a			0	—	0	V	VREFH = AVDD VREFL = AVSS = 0
AD07	VREF	Absolute Reference Voltage	2.5	—	3.6	V	VREF = VREFH - VREFL
AD08	IREF	Current Drain	—	—	10	μA	ADC off
AD08a	IAD	Operating Current	— —	7.0 2.7	9.0 3.2	mA mA	10-bit ADC mode, see **Note 1** 12-bit ADC mode, see **Note 1**
Analog Input							
AD12	VINH	Input Voltage Range VINH	VINL	—	VREFH	V	This voltage reflects Sample and Hold Channels 0, 1, 2 and 3 (CH0-CH3), positive input
AD13	VINL	Input Voltage Range VINL	VREFL	—	AVSS + 1V	V	This voltage reflects Sample and Hold Channels 0, 1, 2 and 3 (CH0-CH3), negative input
AD17	RIN	Recommended Impedance of Analog Voltage Source	— —	— —	200 200	Ω Ω	10-bit ADC 12-bit ADC

Note 1: These parameters are not characterized or tested in manufacturing.

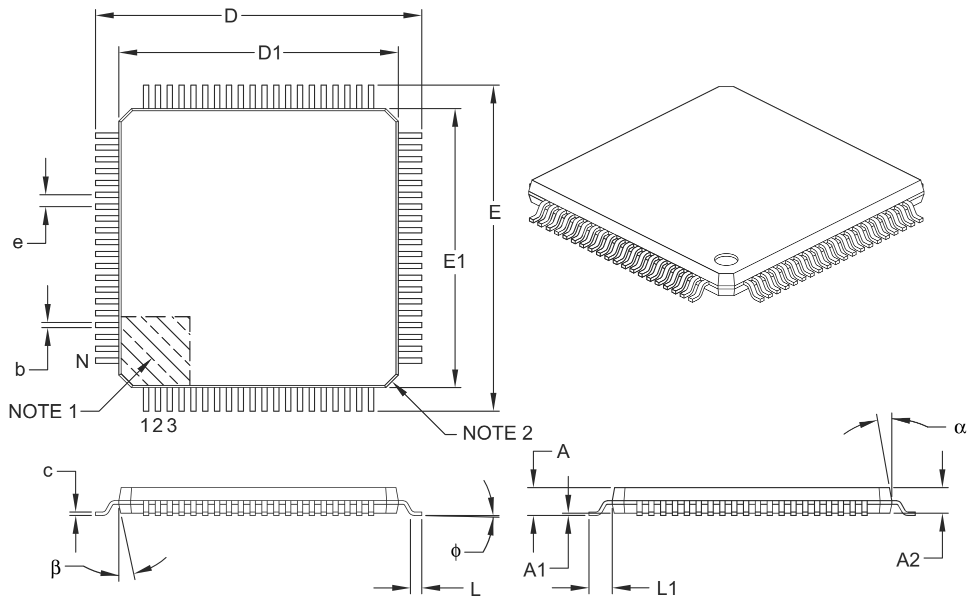
80-Lead Plastic Thin Quad Flatpack (PT) – 12x12x1 mm Body, 2.00 mm [TQFP]

Note:	For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Leads	N		80	
Lead Pitch	e		0.50 BSC	
Overall Height	A	–	–	1.20
Molded Package Thickness	A2	0.95	1.00	1.05
Standoff	A1	0.05	–	0.15
Foot Length	L	0.45	0.60	0.75
Footprint	L1		1.00 REF	
Foot Angle	φ	0°	3.5°	7°
Overall Width	E		14.00 BSC	
Overall Length	D		14.00 BSC	
Molded Package Width	E1		12.00 BSC	
Molded Package Length	D1		12.00 BSC	
Lead Thickness	c	0.09	–	0.20
Lead Width	b	0.17	0.22	0.27
Mold Draft Angle Top	α	11°	12°	13°
Mold Draft Angle Bottom	β	11°	12°	13°

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Chamfers at corners are optional; size may vary.
3. Dimensions D1 and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.25 mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.

Revision C (March 2011)

This revision includes typographical and formatting changes throughout the data sheet text. In addition, all instances of VDDCORE have been removed.

All other major changes are referenced by their respective section in the following table.

TABLE B-2: MAJOR SECTION UPDATES

Section Name	Update Description
Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers"	Updated the title of **Section 2.3 "CPU Logic Filter Capacitor Connection (VCAP)"**. The frequency limitation for device PLL start-up conditions was updated in **Section 2.7 "Oscillator Value Conditions on Device Start-up"**. The second paragraph in **Section 2.9 "Unused I/Os"** was updated.
Section 4.0 "Memory Organization"	The All Resets values for the following SFRs in the Timer Register Map were changed (see Table 4-6): • TMR1 • TMR2 • TMR3 • TMR4 • TMR5 • TMR6 • TMR7 • TMR8 • TMR9
Section 9.0 "Oscillator Configuration"	Added Note 3 to the OSCCON: Oscillator Control Register (see Register 9-1). Added Note 2 to the CLKDIV: Clock Divisor Register (see Register 9-2). Added Note 1 to the PLLFBD: PLL Feedback Divisor Register (see Register 9-3). Added Note 2 to the OSCTUN: FRC Oscillator Tuning Register (see Register 9-4).
Section 22.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)"	Updated the VREFL references in the ADC1 module block diagram (see Figure 22-1).
Section 23.0 "Special Features"	Added a new paragraph and removed the third paragraph in **Section 23.1 "Configuration Bits"**. Added the column "RTSP Effects" to the Configuration Bits Descriptions (see Table 23-2).
