Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	34
Number of Gates	3000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	44-LCC (J-Lead)
Supplier Device Package	44-PLCC (16.59x16.59)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a40mx02-3plg44

3.4.6 Test Circuitry and Silicon Explorer II Probe

MX devices contain probing circuitry that provides built-in access to every node in a design, via the use of Silicon Explorer II. Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer software, allow users to examine any of the internal nets of the device while it is operating in a prototyping or a production system. The user can probe into an MX device without changing the placement and routing of the design and without using any additional resources. Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle and providing a true representation of the device under actual functional situations.

Silicon Explorer II samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

Silicon Explorer II is used to control the MODE, DCLK, SDI and SDO pins in MX devices to select the desired nets for debugging. The user simply assigns the selected internal nets in the Silicon Explorer II software to the PRA/PRB output pins for observation. Probing functionality is activated when the MODE pin is held HIGH.

Figure 12, page 16 illustrates the interconnection between Silicon Explorer II and 40MX devices, while Figure 13, page 17 illustrates the interconnection between Silicon Explorer II and 42MX devices

To allow for probing capabilities, the security fuses must not be programmed. (See User Security, page 12 for the security fuses of 40MX and 42MX devices). Table 8, page 17 summarizes the possible device configurations for probing.

PRA and PRB pins are dual-purpose pins. When the "Reserve Probe Pin" is checked in the Designer software, PRA and PRB pins are reserved as dedicated outputs for probing. If PRA and PRB pins are required as user I/Os to achieve successful layout and "Reserve Probe Pin" is checked, the layout tool will override the option and place user I/Os on PRA and PRB pins.

Figure 12 • Silicon Explorer II Setup with 40MX

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • 42MX IEEE 1149.1 Boundary Scan Circuitry

Table 9 • Test Access Port Descriptions

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • Supported BST Public Instructions

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

Figure 35 • 40MX Junction Temperature and Voltage Derating Curves (Normalized to $T_J = 25^\circ\text{C}$, $V_{CC} = 5.0\text{ V}$)

Note: This derating factor applies to all routing and propagation delays

Table 30 • 42MX Temperature and Voltage Derating Factors (Normalized to $T_J = 25^\circ\text{C}$, $V_{CCA} = 3.3\text{ V}$)

3.00	0.97	1.00	1.10	1.15	1.32	1.36	1.45
3.30	0.84	0.87	0.96	1.00	1.15	1.18	1.26
3.60	0.81	0.84	0.92	0.96	1.10	1.13	1.21

Figure 36 • 42MX Junction Temperature and Voltage Derating Curves (Normalized to $T_J = 25^\circ\text{C}$, $V_{CCA} = 3.3\text{ V}$)

Note: This derating factor applies to all routing and propagation delays

Table 31 • 40MX Temperature and Voltage Derating Factors (Normalized to $T_J = 25^\circ\text{C}$, $V_{CC} = 3.3\text{ V}$)

40MX Voltage	Temperature						
	-55°C	-40°C	0°C	25°C	70°C	85°C	125°C
3.00	1.08	1.12	1.21	1.26	1.50	1.64	2.00
3.30	0.86	0.89	0.96	1.00	1.19	1.30	1.59

Table 33 • Timing Parameters for 33 MHz PCI

Symbol	Parameter	PCI		A42MX24		A42MX36		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
$t_{SU(PTP)}$	Input Set-Up Time to CLK—Point-to-Point	10, 12 ²	—	1.5	—	1.5	—	ns
t_H	Input Hold to CLK	0	—	0	—	0	—	ns

1. TOFF is system dependent. MX PCI devices have 7.4 ns turn-off time, reflection is typically an additional 10 ns.
2. REQ# and GNT# are point-to-point signals and have different output valid delay and input setup times than do bussed signals. GNT# has a setup of 10; REW# has a setup of 12.

3.11.6.1 Timing Characteristics

The following tables list the timing characteristics.

**Table 34 • A40MX02 Timing Characteristics (Nominal 5.0 V Operation)
(Worst-Case Commercial Conditions, VCC = 4.75 V, T_J = 70°C)**

Parameter / Description		–3 Speed		–2 Speed		–1 Speed		Std Speed		–F Speed		Units

1. For dual-module macros, use t_{PD1} + t_{RD1} + t_{PDn}, t_{CO} + t_{RD1} + t_{PDn}, or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading.

3.12 Pin Descriptions

This section lists the pin descriptions for 40MX and 42MX series FPGAs.

CLK/A/B, I/O Global Clock

Clock inputs for clock distribution networks. CLK is for 40MX while CLKA and CLKB are for 42MX devices. The clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

DCLK, I/O Diagnostic Clock

Clock input for diagnostic probe and device programming. DCLK is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

GND, Ground

Input LOW supply voltage.

I/O, Input/Output
