### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

**Figure 14 • 42MX IEEE 1149.1 Boundary Scan Circuitry**

**Table 9 • Test Access Port Descriptions**

| Port                      | Description                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TMS<br>(Test Mode Select) | Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).                                                                                                                                          |
| TCK<br>(Test Clock Input) | Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz. |
| TDI<br>(Test Data Input)  | Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.                                                                                                                                                  |
| TDO<br>(Test Data Output) | Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.                                                                                            |

**Table 10 • Supported BST Public Instructions**

| Instruction    | IR Code (IR2.IR0) | Instruction Type | Description                                                                                                                                                            |
|----------------|-------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXTEST         | 000               | Mandatory        | Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins. |
| SAMPLE/PRELOAD | 001               | Mandatory        | Allows a snapshot of the signals at the device pins to be captured and examined during operation                                                                       |
| HIGH Z         | 101               | Optional         | Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.                                                                |
| CLAMP          | 110               | Optional         | Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.           |
| BYPASS         | 111               | Mandatory        | Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.                      |

Additionally, the back-annotation flow is compatible with all the major simulators and the simulation results can be cross-probed with Silicon Explorer II, Microsemi's integrated verification and logic analysis tool. Another tool included in the Libero software is the SmartGen macro builder, which easily creates popular and commonly used logic functions for implementation into your schematic or HDL design.

Microsemi's Libero software is compatible with the most popular FPGA design entry and verification tools from companies such as Mentor Graphics, Synopsys, and Cadence design systems.

See the Libero IDE web content at [www.microsemi.com/soc/products/software/libero/default.aspx](http://www.microsemi.com/soc/products/software/libero/default.aspx) for further information on licensing and current operating system support.

## 3.7 5.0 V Operating Conditions

The following tables show 5.0 V operating conditions.

**Table 12 • Absolute Maximum Ratings for 40MX Devices\***

| Symbol           | Parameter           | Limits          | Units |
|------------------|---------------------|-----------------|-------|
| VCC              | DC Supply Voltage   | −0.5 to +7.0    | V     |
| VI               | Input Voltage       | −0.5 to VCC+0.5 | V     |
| VO               | Output Voltage      | −0.5 to VCC+0.5 | V     |
| t <sub>STG</sub> | Storage Temperature | −65 to +150     | °C    |

**Note:** \*Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

**Table 13 • Absolute Maximum Ratings for 42MX Devices\***

| Symbol           | Parameter                   | Limits           | Units |
|------------------|-----------------------------|------------------|-------|
| VCCI             | DC Supply Voltage for I/Os  | −0.5 to +7.0     | V     |
| VCCA             | DC Supply Voltage for Array | −0.5 to +7.0     | V     |
| VI               | Input Voltage               | −0.5 to VCCI+0.5 | V     |
| VO               | Output Voltage              | −0.5 to VCCI+0.5 | V     |
| t <sub>STG</sub> | Storage Temperature         | −65 to +150      | °C    |

**Figure 20 • 42MX Timing Model (SRAM Functions)**

**Note:** Values are shown for A42MX36 –3 at 5.0 V worst-case commercial conditions.

### 3.10.1 Parameter Measurement

The following figures show parameter measurement details.

**Figure 21 • Output Buffer Delays**

Figure 27 • Output Buffer Latches

### 3.10.4 Decode Module Timing

The following figure shows decode module timing.
