Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

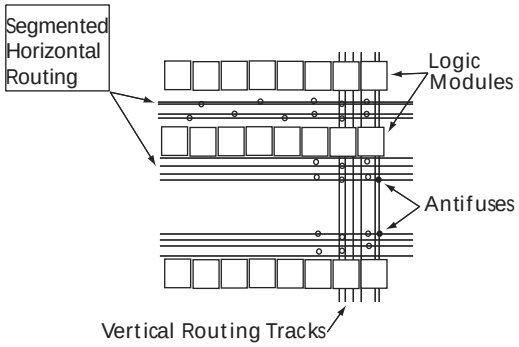
The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	69
Number of Gates	6000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	80-TQFP
Supplier Device Package	80-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a40mx04-1vqg80i

3.2.3.3 Antifuse Structures

An antifuse is a “normally open” structure. The use of antifuses to implement a programmable logic device results in highly testable structures as well as efficient programming algorithms. There are no pre-existing connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed and individual circuit structures to be tested, which can be done before and after programming. For instance, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Figure 7 • **MX Routing Structure**



3.2.4 Clock Networks

The 40MX devices have one global clock distribution network (CLK). A signal can be put on the CLK network by being routed through the CLKBUF buffer.

In 42MX devices, there are two low-skew, high-fanout clock distribution networks, referred to as CLKA and CLKB. Each network has a clock module (CLKMOD) that can select the source of the clock signal from any of the following (Figure 8, page 11):

- Externally from the CLKA pad, using CLKBUF buffer
- Externally from the CLKB pad, using CLKBUF buffer
- Internally from the CLKINTA input, using CLKINT buffer
- Internally from the CLKINTB input, using CLKINT buffer

The clock modules are located in the top row of I/O modules. Clock drivers and a dedicated horizontal clock track are located in each horizontal routing channel.

Clock input pads in both 40MX and 42MX devices can also be used as normal I/Os, bypassing the clock networks.

The A42MX36 device has four additional register control resources, called quadrant clock networks (Figure 9, page 11). Each quadrant clock provides a local, high-fanout resource to the contiguous logic modules within its quadrant of the device. Quadrant clock signals can originate from specific I/O pins or from the internal array and can be used as a secondary register clock, register clear, or output enable.

f_{q2} = Average second routed array clock rate in MHz)

Table 7 • **Fixed Capacitance Values for MX FPGAs (pF)**

Device Type	r1 routed_Clk1	r2 routed_Clk2
A40MX02	41.4	N/A
A40MX04	68.6	N/A
A42MX09	118	118
A42MX16	165	165
A42MX24	185	185
A42MX36	220	220

3.4.6 Test Circuitry and Silicon Explorer II Probe

MX devices contain probing circuitry that provides built-in access to every node in a design, via the use of Silicon Explorer II. Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer software, allow users to examine any of the internal nets of the device while it is operating in a prototyping or a production system. The user can probe into an MX device without changing the placement and routing of the design and without using any additional resources. Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle and providing a true representation of the device under actual functional situations.

Silicon Explorer II samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

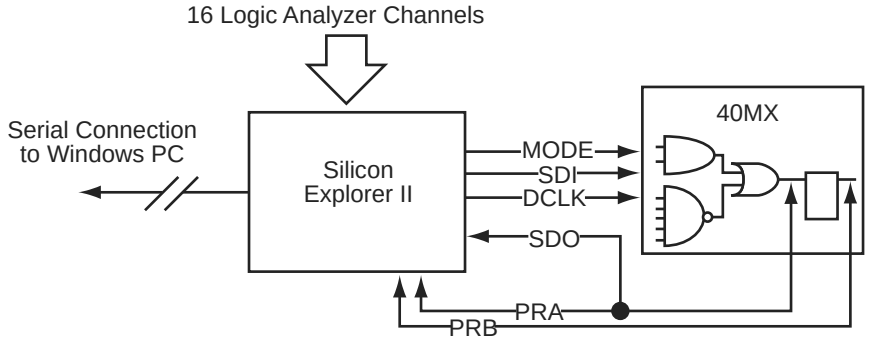
Silicon Explorer II is used to control the MODE, DCLK, SDI and SDO pins in MX devices to select the desired nets for debugging. The user simply assigns the selected internal nets in the Silicon Explorer II software to the PRA/PRB output pins for observation. Probing functionality is activated when the MODE pin is held HIGH.

Figure 12, page 16 illustrates the interconnection between Silicon Explorer II and 40MX devices, while Figure 13, page 17 illustrates the interconnection between Silicon Explorer II and 42MX devices

To allow for probing capabilities, the security fuses must not be programmed. (See User Security, page 12 for the security fuses of 40MX and 42MX devices). Table 8, page 17 summarizes the possible device configurations for probing.

PRA and PRB pins are dual-purpose pins. When the “Reserve Probe Pin” is checked in the Designer software, PRA and PRB pins are reserved as dedicated outputs for probing. If PRA and PRB pins are required as user I/Os to achieve successful layout and “Reserve Probe Pin” is checked, the layout tool will override the option and place user I/Os on PRA and PRB pins.

Figure 12 • **Silicon Explorer II Setup with 40MX**



3.4.9 JTAG Mode Activation

The JTAG test logic circuit is activated in the Designer software by selecting **Tools > Device Selection**. This brings up the Device Selection dialog box as shown in the following figure. The JTAG test logic circuit can be enabled by clicking the “Reserve JTAG Pins” check box. The following table explains the pins' behavior in either mode.

Figure 15 • **Device Selection Wizard**

Table 11 • **Boundary Scan Pin Configuration and Functionality**

Reserve JTAG	Checked	Unchecked
TCK	BST input; must be terminated to logical HIGH or LOW to avoid floating	User I/O
TDI, TMS	BST input; may float or be tied to HIGH	User I/O
TDO	BST output; may float or be connected to TDI of another device	User I/O

3.4.10 TRST Pin and TAP Controller Reset

An active reset (TRST) pin is not supported; however, MX devices contain power-on circuitry that resets the boundary scan circuitry upon power-up. Also, the TMS pin is equipped with an internal pull-up resistor. This allows the TAP controller to remain in or return to the Test-Logic-Reset state when there is no input or when a logical 1 is on the TMS pin. To reset the controller, TMS must be HIGH for at least five TCK cycles.

3.4.11 Boundary Scan Description Language (BSDL) File

Conforming to the IEEE Standard 1149.1 requires that the operation of the various JTAG components be documented. The BSDL file provides the standard format to describe the JTAG components that can be used by automatic test equipment software. The file includes the instructions that are supported, instruction bit pattern, and the boundary-scan chain order. For an in-depth discussion on BSDL files, see the BSDL Files Format Description application note.

BSDL files are grouped into two categories - generic and device-specific. The generic files assign all user I/Os as inouts. Device-specific files assign user I/Os as inputs, outputs or inouts.

Generic files for MX devices are available on the Microsemi SoC Product Group's website:

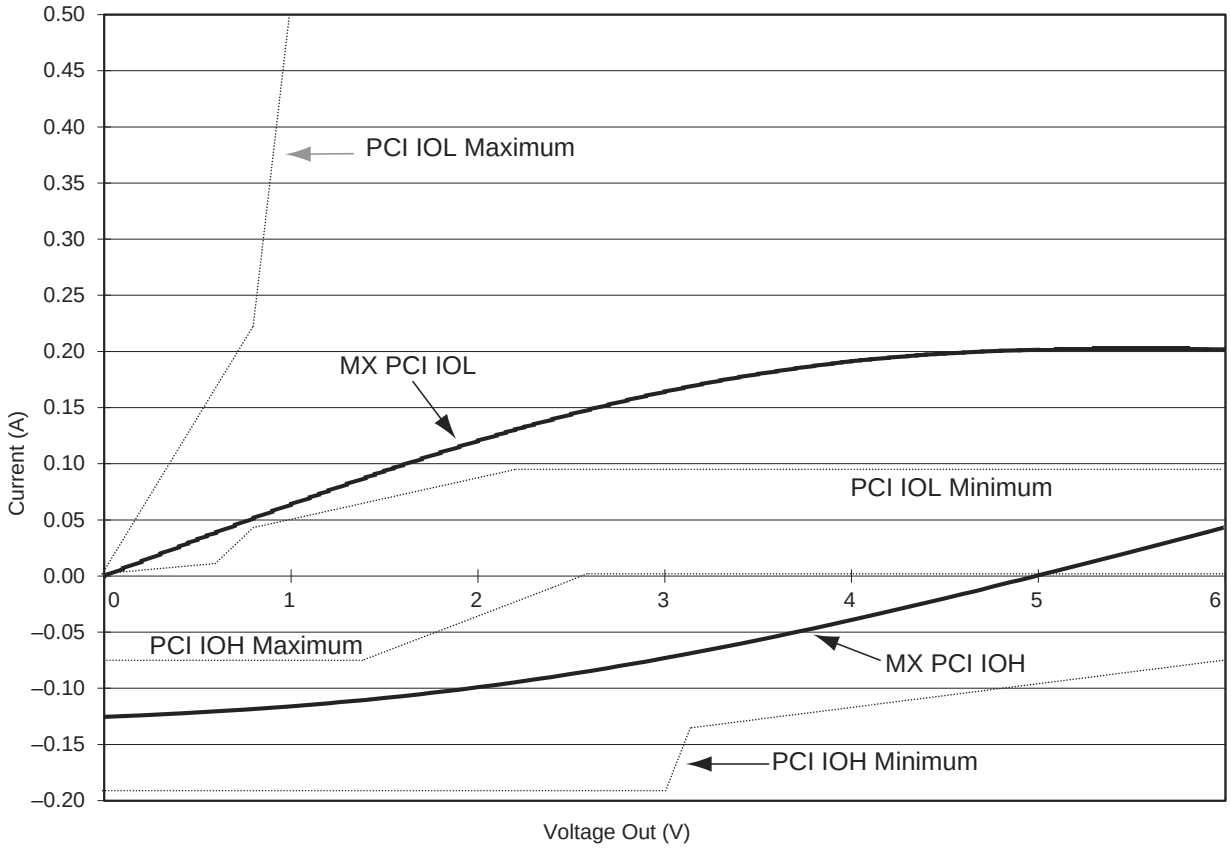
http://www.microsemi.com/soc/techdocs/models/bsdl.html.

3.5 Development Tool Support

The MX family of FPGAs is fully supported by Libero® Integrated Design Environment (IDE). Libero IDE is a design management environment, seamlessly integrating design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design in a single environment. Libero IDE includes SynplifyPro from Synopsys, ModelSim® HDL Simulator from Mentor Graphics® and Viewdraw.

Libero IDE includes place-and-route and provides a comprehensive suite of backend support tools for FPGA development, including timing-driven place-and-route, and a world-class integrated static timing analyzer and constraints editor.

Figure 16 • **Typical Output Drive Characteristics (Based Upon Measured Data)**



3.9.4 Junction Temperature (T_J)

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a \quad (1)$$

EQ 4

where:

- T_a = Ambient Temperature
- ΔT = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$ (2)
- P = Power
- θ_{ja} = Junction to ambient of package. θ_{ja} numbers are located in Table 27, page 29.

3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is θ_{jc}, and the junction-to-ambient air characteristic is θ_{ja}. The thermal characteristics for θ_{ja} are shown with two different air flow rates.

The maximum junction temperature is 150°C.

Maximum power dissipation for commercial- and industrial-grade devices is a function of θ_{ja}.

Note: This derating factor applies to all routing and propagation delays

3.11.5 PCI System Timing Specification

The following tables list the critical PCI timing parameters and the corresponding timing parameters for the MX PCI-compliant devices.

3.11.6 PCI Models

Microsemi provides synthesizable VHDL and Verilog-HDL models for a PCI Target interface, a PCI Target and Target+DMA Master interface. Contact the Microsemi sales representative for more details.

Clock signal to shift the Boundary Scan Test (BST) data into the device. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDI, I/OTest Data In

Serial data input for BST instructions and data. Data is shifted in on the rising edge of TCK. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDO, I/OTest Data Out

Serial data output for BST instructions and test data. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TMS, I/OTest Mode Select

The TMS pin controls the use of the IEEE 1149.1 Boundary Scan pins (TCK, TDI, TDO). In flexible mode when the TMS pin is set LOW, the TCK, TDI and TDO pins are boundary scan pins. Once the boundary scan pins are in test mode, they will remain in that mode until the internal boundary scan state machine reaches the "logic reset" state. At this point, the boundary scan pins will be released and will function as regular I/O pins. The "logic reset" state is reached 5 TCK cycles after the TMS pin is set HIGH. In dedicated test mode, TMS functions as specified in the IEEE 1149.1 specifications. IEEE JTAG specification recommends a 10kΩ pull-up resistor on the pin. BST pins are only available in A42MX24 and A42MX36 devices.

VCC, Supply Voltage

Input supply voltage for 40MX devices

VCCA, Supply Voltage

Supply voltage for array in 42MX devices

VCCI, Supply Voltage

Supply voltage for I/Os in 42MX devices

WD, I/OWide Decode Output

When a wide decode module is used in a 42MX device this pin can be used as a dedicated output from the wide decode module. This direct connection eliminates additional interconnect delays associated with regular logic modules. To implement the direct I/O connection, connect an output buffer of any type to the output of the wide decode macro and place this output on one of the reserved WD pins.

4 Package Pin Assignments

The following figures and tables give the details of the package pin assignments.
