### [Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	69
Number of Gates	6000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)

### 3.4.6 Test Circuitry and Silicon Explorer II Probe

MX devices contain probing circuitry that provides built-in access to every node in a design, via the use of Silicon Explorer II. Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer software, allow users to examine any of the internal nets of the device while it is operating in a prototyping or a production system. The user can probe into an MX device without changing the placement and routing of the design and without using any additional resources. Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle and providing a true representation of the device under actual functional situations.

Silicon Explorer II samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

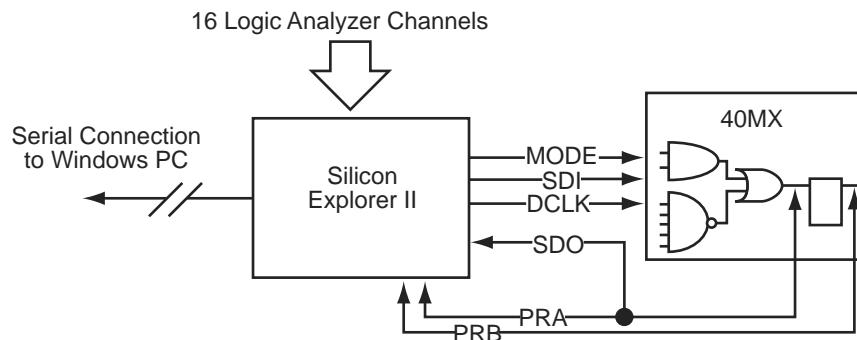

Silicon Explorer II is used to control the MODE, DCLK, SDI and SDO pins in MX devices to select the desired nets for debugging. The user simply assigns the selected internal nets in the Silicon Explorer II software to the PRA/PRB output pins for observation. Probing functionality is activated when the MODE pin is held HIGH.

Figure 12, page 16 illustrates the interconnection between Silicon Explorer II and 40MX devices, while Figure 13, page 17 illustrates the interconnection between Silicon Explorer II and 42MX devices.

To allow for probing capabilities, the security fuses must not be programmed. (See User Security, page 12 for the security fuses of 40MX and 42MX devices). Table 8, page 17 summarizes the possible device configurations for probing.

PRA and PRB pins are dual-purpose pins. When the "Reserve Probe Pin" is checked in the Designer software, PRA and PRB pins are reserved as dedicated outputs for probing. If PRA and PRB pins are required as user I/Os to achieve successful layout and "Reserve Probe Pin" is checked, the layout tool will override the option and place user I/Os on PRA and PRB pins.

## 3.8 3.3 V Operating Conditions

The following table shows 3.3 V operating conditions.

**Table 16 • Absolute Maximum Ratings for 40MX Devices\***

Symbol	Parameter	Limits	Units
VCC	DC Supply Voltage	-0.5 to +7.0	V
VI	Input Voltage	-0.5 to VCC + 0.5	V
VO	Output Voltage	-0.5 to VCC + 0.5	V
t <sub>STG</sub>	Storage Temperature	-65 to + 150	°C

**Note:** \*Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

**Table 17 • Absolute Maximum Ratings for 42MX Devices\***

Symbol	Parameter	Limits	Units
VCCI	DC Supply Voltage for I/Os	-0.5 to +7.0	V
VCCA	DC Supply Voltage for Array	-0.5 to +7.0	V
VI	Input Voltage	-0.5 to VCCI+0.5	V
VO	Output Voltage	-0.5 to VCCI+0.5	V
t <sub>STG</sub>	Storage Temperature	-65 to +150	°C

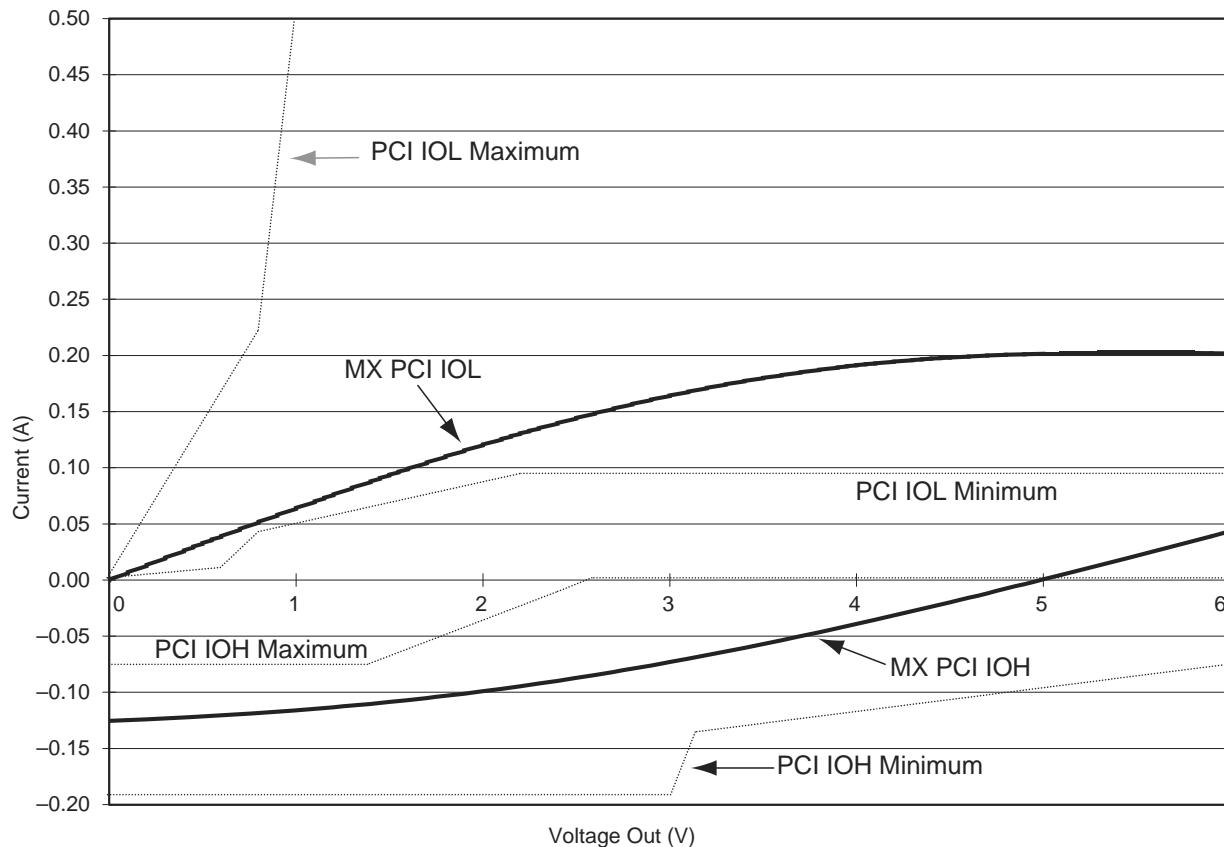

**Note:** \*Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

**Table 18 • Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature Range*	0 to +70	-40 to +85	-55 to +125	°C
VCC (40MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VCCA (42MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VCCI (42MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V

**Note:** \*Ambient temperature ( $T_A$ ) is used for commercial and industrial grades; case temperature ( $T_C$ ) is used for military grades.

All the following tables show various specifications and operating conditions of 40MX and 42MX FPGAs.

**Figure 16 • Typical Output Drive Characteristics (Based Upon Measured Data)**

### 3.9.4 Junction Temperature ( $T_J$ )

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a(1)$$

EQ 4

where:

- $T_a$  = Ambient Temperature
- $\Delta T$  = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$  (2)
- $P$  = Power
- $\theta_{ja}$  = Junction to ambient of package.  $\theta_{ja}$  numbers are located in Table 27, page 29.

### 3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is  $\theta_{jc}$ , and the junction-to-ambient air characteristic is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown with two different air flow rates.

The maximum junction temperature is 150°C.

Maximum power dissipation for commercial- and industrial-grade devices is a function of  $\theta_{ja}$ .

- For dual-module macros, use  $t_{PD1} + t_{RD1} + t_{PDn}$ ,  $t_{CO} + t_{RD1} + t_{PDn}$ , or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
- Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
- Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.

1. For dual-module macros, use  $t_{PD1} + t_{RD1} + t_{PDn}$ ,  $t_{CO} + t_{RD1} + t_{PDn}$ , or  $t_{PD1} + t_{RD1} + t_{SUD}$ , point and position whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading
