

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	69
Number of Gates	6000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 125°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a40mx04-pl84a">https://www.e-xfl.com/product-detail/microchip-technology/a40mx04-pl84a</a>

## 2.6 Temperature Grade Offerings

**Table 4 • Temperature Grade Offerings**

Package	A40MX02	A40MX04	A42MX09	A42MX16	A42MX24	A42MX36
PLCC 44	C, I, M	C, I, M				
PLCC 68	C, I, A, M	C, I, M				
PLCC 84		C, I, A, M	C, I, A, M	C, I, M	C, I, M	
PQFP 100	C, I, A, M	C, I, A, M	C, I, A, M	C, I, M		
PQFP 144			C			
PQFP 160			C, I, A, M	C, I, M	C, I, A, M	
PQFP 208				C, I, A, M	C, I, A, M	C, I, A, M
PQFP 240						C, I, A, M
VQFP 80	C, I, A, M	C, I, A, M				
VQFP 100			C, I, A, M	C, I, A, M		
TQFP 176			C, I, A, M	C, I, A, M	C, I, A, M	
PBGA 272						C, I, M
CQFP 172				C, M, B		
CQFP 208						C, M, B
CQFP 256						C, M, B
CPGA 132			C, M, B			

**Note:** C = Commercial  
 I = Industrial  
 A = Automotive  
 M = Military  
 B = MIL-STD-883 Class B

## 2.7 Speed Grade Offerings

**Table 5 • Speed Grade Offerings**

	- F	Std	-1	-2	-3
C	P	P	P	P	P
I		P	P	P	P
A		P			
M		P	P		
B		P	P		

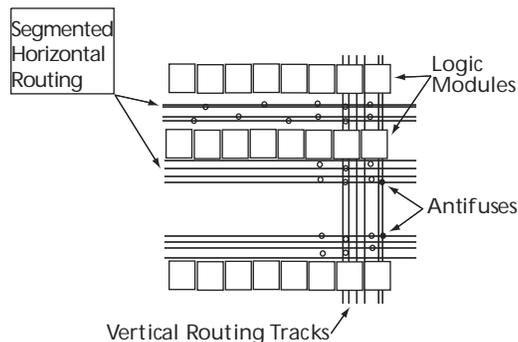

**Note:** See the 40MX and 42MX Automotive Family FPGAs datasheet for details on automotive-grade MX offerings.

Contact your local *Microsemi Sales representative* for device availability.

### 3.2.3.3 Antifuse Structures

An antifuse is a “normally open” structure. The use of antifuses to implement a programmable logic device results in highly testable structures as well as efficient programming algorithms. There are no pre-existing connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed and individual circuit structures to be tested, which can be done before and after programming. For instance, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Figure 7 • MX Routing Structure

### 3.2.4 Clock Networks

The 40MX devices have one global clock distribution network (CLK). A signal can be put on the CLK network by being routed through the CLKBUF buffer.

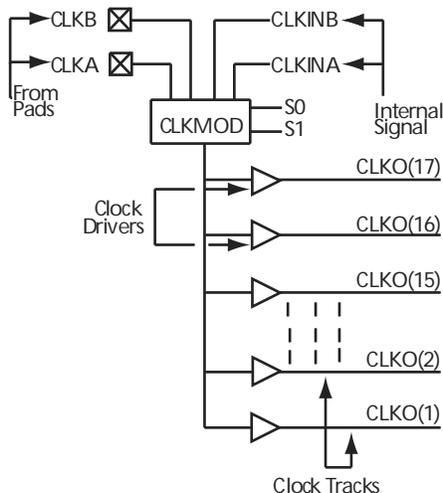

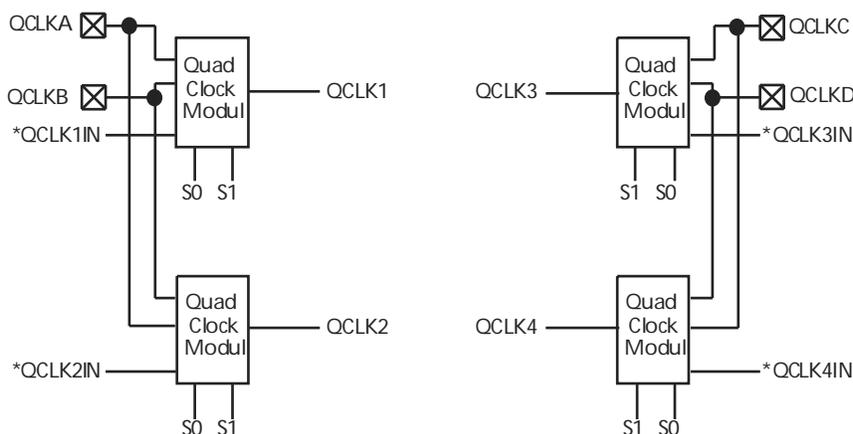

In 42MX devices, there are two low-skew, high-fanout clock distribution networks, referred to as CLKA and CLKB. Each network has a clock module (CLKMOD) that can select the source of the clock signal from any of the following (Figure 8, page 11):

- Externally from the CLKA pad, using CLKBUF buffer
- Externally from the CLKB pad, using CLKBUF buffer
- Internally from the CLKINTA input, using CLKINT buffer
- Internally from the CLKINTB input, using CLKINT buffer

The clock modules are located in the top row of I/O modules. Clock drivers and a dedicated horizontal clock track are located in each horizontal routing channel.

Clock input pads in both 40MX and 42MX devices can also be used as normal I/Os, bypassing the clock networks.

The A42MX36 device has four additional register control resources, called quadrant clock networks (Figure 9, page 11). Each quadrant clock provides a local, high-fanout resource to the contiguous logic modules within its quadrant of the device. Quadrant clock signals can originate from specific I/O pins or from the internal array and can be used as a secondary register clock, register clear, or output enable.

**Figure 8 • Clock Networks of 42MX Devices****Figure 9 • Quadrant Clock Network of A42MX36 Devices**

**Note:** \*QCLK1IN, QCLK2IN, QCLK3IN, and QCLK4IN are internally-generated signals.

### 3.2.5 MultiPlex I/O Modules

42MX devices feature MultiPlex I/Os and support 5.0 V, 3.3 V, and mixed 3.3 V/5.0 V operations.

The MultiPlex I/O modules provide the interface between the device pins and the logic array. Figure 10, page 12 is a block diagram of the 42MX I/O module. A variety of user functions, determined by a library macro selection, can be implemented in the module. (See the *Antifuse Macro Library Guide* for more information.) All 42MX I/O modules contain tristate buffers, with input and output latches that can be configured for input, output, or bidirectional operation.

All 42MX devices contain flexible I/O structures, where each output pin has a dedicated output-enable control (Figure 10, page 12). The I/O module can be used to latch input or output data, or both, providing fast set-up time. In addition, the Designer software tools can build a D-type flip-flop using a C-module combined with an I/O module to register input and output signals. See the *Antifuse Macro Library Guide* for more details.

A42MX24 and A42MX36 devices also offer selectable PCI output drives, enabling 100% compliance with version 2.1 of the PCI specification. For low-power systems, all inputs and outputs are turned off to reduce current consumption to below 500  $\mu$ A.

To achieve 5.0 V or 3.3 V PCI-compliant output drives on A42MX24 and A42MX36 devices, a chip-wide PCI fuse is programmed via the Device Selection Wizard in the Designer software (Figure 11, page 12). When the PCI fuse is not programmed, the output drive is standard.

- $V_{CCA}$  = Power supply in volts (V)
- $F$  = Switching frequency in megahertz (MHz)

### 3.4.4 Equivalent Capacitance

Equivalent capacitance is calculated by measuring  $I_{CCActive}$  at a specified frequency and voltage for each circuit component of interest. Measurements have been made over a range of frequencies at a fixed value of VCC. Equivalent capacitance is frequency-independent, so the results can be used over a wide range of operating conditions. Equivalent capacitance values are shown below.

### 3.4.5 $C_{EQ}$ Values for Microsemi MX FPGAs

Modules ( $C_{EQM}$ ) 3.5

Input Buffers ( $C_{EQI}$ ) 6.9

Output Buffers ( $C_{EQO}$ ) 18.2

Routed Array Clock Buffer Loads ( $C_{EQCR}$ ) 1.4

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. The equation below shows a piece-wise linear summation over all components.

$$\text{Power} = V_{CCA}^2 * [(m \times C_{EQM} * f_m)_{\text{modules}} + (n * C_{EQI} * f_n)_{\text{inputs}} + (p * (C_{EQO} + C_L) * f_p)_{\text{outputs}} + 0.5 * (q_1 * C_{EQCR} * f_{q1})_{\text{routed\_clk1}} + (r_1 * f_{q1})_{\text{routed\_clk1}} + 0.5 * (q_2 * C_{EQCR} * f_{q2})_{\text{routed\_clk2}} + (r_2 * f_{q2})_{\text{routed\_clk2}}] \quad (2)$$

**EQ 3**

where:

$m$  = Number of logic modules switching at frequency  $f_m$

$n$  = Number of input buffers switching at frequency  $f_n$

$p$  = Number of output buffers switching at frequency  $f_p$

$q_1$  = Number of clock loads on the first routed array clock

$q_2$  = Number of clock loads on the second routed array clock

$r_1$  = Fixed capacitance due to first routed array clock

$r_2$  = Fixed capacitance due to second routed array clock

$C_{EQM}$  = Equivalent capacitance of logic modules in pF

$C_{EQI}$  = Equivalent capacitance of input buffers in pF

$C_{EQO}$  = Equivalent capacitance of output buffers in pF

$C_{EQCR}$  = Equivalent capacitance of routed array clock in pF

$C_L$  = Output load capacitance in pF

$f_m$  = Average logic module switching rate in MHz

$f_n$  = Average input buffer switching rate in MHz

$f_p$  = Average output buffer switching rate in MHz

$f_{q1}$  = Average first routed array clock rate in MHz

### 3.4.9 JTAG Mode Activation

The JTAG test logic circuit is activated in the Designer software by selecting **Tools > Device Selection**. This brings up the Device Selection dialog box as shown in the following figure. The JTAG test logic circuit can be enabled by clicking the “Reserve JTAG Pins” check box. The following table explains the pins' behavior in either mode.

**Figure 15 • Device Selection Wizard**

**Table 11 • Boundary Scan Pin Configuration and Functionality**

Reserve JTAG	Checked	Unchecked
TCK	BST input; must be terminated to logical HIGH or LOW to avoid floating	User I/O
TDI, TMS	BST input; may float or be tied to HIGH	User I/O
TDO	BST output; may float or be connected to TDI of another device	User I/O

### 3.4.10 TRST Pin and TAP Controller Reset

An active reset (TRST) pin is not supported; however, MX devices contain power-on circuitry that resets the boundary scan circuitry upon power-up. Also, the TMS pin is equipped with an internal pull-up resistor. This allows the TAP controller to remain in or return to the Test-Logic-Reset state when there is no input or when a logical 1 is on the TMS pin. To reset the controller, TMS must be HIGH for at least five TCK cycles.

### 3.4.11 Boundary Scan Description Language (BSDL) File

Conforming to the IEEE Standard 1149.1 requires that the operation of the various JTAG components be documented. The BSDL file provides the standard format to describe the JTAG components that can be used by automatic test equipment software. The file includes the instructions that are supported, instruction bit pattern, and the boundary-scan chain order. For an in-depth discussion on BSDL files, see the *BSDL Files Format Description* application note.

BSDL files are grouped into two categories - generic and device-specific. The generic files assign all user I/Os as inouts. Device-specific files assign user I/Os as inputs, outputs or inouts.

Generic files for MX devices are available on the Microsemi SoC Product Group's website:

<http://www.microsemi.com/soc/techdocs/models/bsdl.html>.

## 3.5 Development Tool Support

The MX family of FPGAs is fully supported by Libero® Integrated Design Environment (IDE). Libero IDE is a design management environment, seamlessly integrating design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design in a single environment. Libero IDE includes SynplifyPro from Synopsys, ModelSim® HDL Simulator from Mentor Graphics® and Viewdraw.

Libero IDE includes place-and-route and provides a comprehensive suite of backend support tools for FPGA development, including timing-driven place-and-route, and a world-class integrated static timing analyzer and constraints editor.

### 3.9.1 Mixed 5.0V/3.3V Electrical Specifications

**Table 22 • Mixed 5.0V/3.3V Electrical Specifications**

Symbol	Parameter	Commercial		Commercial –F		Industrial		Military		Units
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
VOH <sup>1</sup>	IOH = –10 mA	2.4		2.4						V
	IOH = –4 mA					2.4		2.4		V
VOL <sup>1</sup>	IOL = 10 mA	0.5		0.5						V
	IOL = 6 mA					0.4		0.4		V
VIL		–0.3	0.8	–0.3	0.8	–0.3	0.8	–0.3	0.8	V
VIH <sup>2</sup>		2.0	VCCA + 0.3	2.0	VCCA + 0.3	2.0	VCCA + 0.3	2.0	VCCA + 0.3	V
IL	VIN = 0.5 V		–10		–10		–10		–10	μA
IH	VIN = 2.7 V		–10		–10		–10		–10	μA
Input Transition Time, T <sub>R</sub> and T <sub>F</sub>			500		500		500		500	ns
C <sub>IO</sub> I/O Capacitance			10		10		10		10	pF
Standby Current, ICC <sup>3</sup>	A42MX09		5		25		25		25	mA
	A42MX16		6		25		25		25	mA
	A42MX24, A42MX36		20		25		25		25	mA
Low Power Mode Standby Current			0.5		ICC – 5.0		ICC – 5.0		ICC – 5.0	mA
I/O I/O source sink current	Can be derived from the <i>IBIS model</i> ( <a href="http://www.microsemi.com/soc/techdocs/models/ibis.html">http://www.microsemi.com/soc/techdocs/models/ibis.html</a> )									

1. Only one output tested at a time. VCCI = min.
2. VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
3. All outputs unloaded. All inputs = VCCI or GND

### 3.9.2 Output Drive Characteristics for 5.0 V PCI Signaling

MX PCI device I/O drivers were designed specifically for high-performance PCI systems. Figure 16, page 28 shows the typical output drive characteristics of the MX devices. MX output drivers are compliant with the PCI Local Bus Specification.

**Table 23 • DC Specification (5.0 V PCI Signaling)<sup>1</sup>**

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
VCCI	Supply Voltage for I/Os		4.75	5.25	4.75	5.25 <sup>2</sup>	V
VIH <sup>3</sup>	Input High Voltage		2.0	VCC + 0.5	2.0	VCCI + 0.3	V
VIL	Input Low Voltage		–0.5	0.8	–0.3	0.8	V
I <sub>IH</sub>	Input High Leakage Current	VIN = 2.7 V		70	—	10	μA
I <sub>IL</sub>	Input Low Leakage Current	VIN=0.5 V		–70	—	–10	μA
VOH	Output High Voltage	I <sub>O</sub> UT = –2 mA I <sub>O</sub> UT = –6 mA	2.4		3.84		V
VOL	Output Low Voltage	I <sub>O</sub> UT = 3 mA, 6 mA		0.55	—	0.33	V

A sample calculation of the absolute maximum power dissipation allowed for a TQ176 package at commercial temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (^\circ\text{C}) - \text{Max} \cdot \text{ambient temp} \cdot (^\circ\text{C})}{\theta_{ja} (^\circ\text{C}/\text{W})} = \frac{150^\circ\text{C} - 70^\circ\text{C}}{(28^\circ\text{C})/\text{W}} = 2.86\text{W}$$

EQ 5

The maximum power dissipation for military-grade devices is a function of  $\theta_{jc}$ . A sample calculation of the absolute maximum power dissipation allowed for CQFP 208-pin package at military temperature and still air is given in the following equation

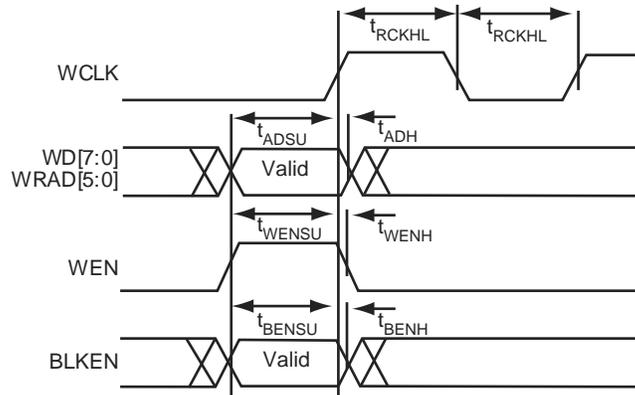

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (^\circ\text{C}) - \text{Max} \cdot \text{ambient temp} \cdot (^\circ\text{C})}{\theta_{jc} (^\circ\text{C}/\text{W})} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{(6.3^\circ\text{C})/\text{W}} = 3.97\text{W}$$

EQ 6

**Table 27 • Package Thermal Characteristics**
