Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	69
Number of Gates	6000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	80-TQFP
Supplier Device Package	80-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a40mx04-vqg80

About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • **42MX IEEE 1149.1 Boundary Scan Circuitry**

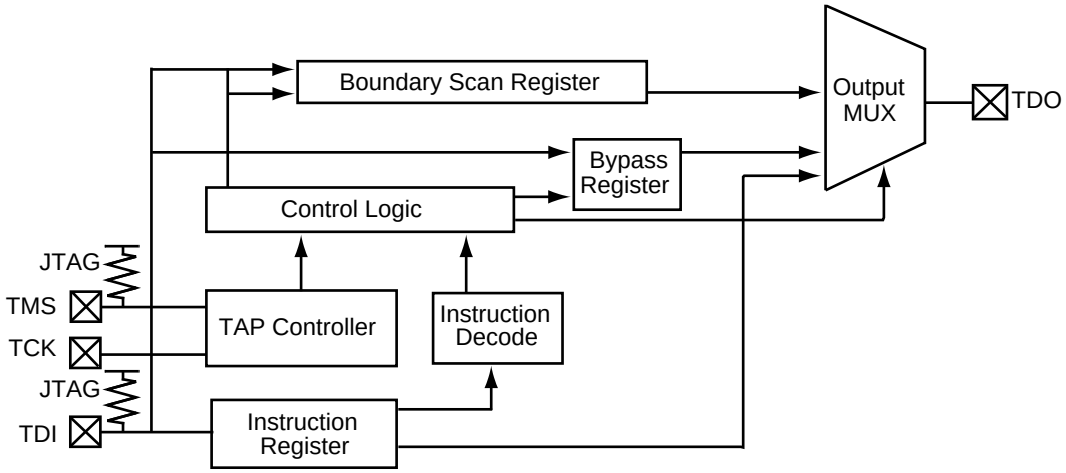

Table 9 • **Test Access Port Descriptions**

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • **Supported BST Public Instructions**

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

3.9.1 Mixed 5.0V/3.3V Electrical Specifications

Table 22 • **Mixed 5.0V/3.3V Electrical Specifications**

		Commercial		Commercial –F		Industrial		Military

Low Power Mode Standby Current			0.5		ICC – 5.0		ICC – 5.0		ICC – 5.0	mA
IIO I/O source sink current	Can be derived from the *IBIS model* (http://www.microsemi.com/soc/techdocs/models/ibis.html)									

1. Only one output tested at a time. VCCI = min.
2. VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
3. All outputs unloaded. All inputs = VCCI or GND

3.9.2 Output Drive Characteristics for 5.0 V PCI Signaling

MX PCI device I/O drivers were designed specifically for high-performance PCI systems. Figure 16, page 28 shows the typical output drive characteristics of the MX devices. MX output drivers are compliant with the PCI Local Bus Specification.

Table 23 • **DC Specification (5.0 V PCI Signaling)[1]**

			PCI		MX		
Symbol	**Parameter**	**Condition**	**Min.**	**Max.**	**Min.**	**Max.**	**Units**
VCCI	Supply Voltage for I/Os		4.75	5.25	4.75	5.25[2]	V
VIH[3]	Input High Voltage		2.0	VCC + 0.5	2.0	VCCI + 0.3	V
VIL	Input Low Voltage		–0.5	0.8	–0.3	0.8	V
IIH	Input High Leakage Current	VIN = 2.7 V		70	—	10	µA
IIL	Input Low Leakage Current	VIN=0.5 V		–70	—	–10	µA
VOH	Output High Voltage	IOUT = –2 mA IOUT = –6 mA	2.4		 3.84		V
VOL	Output Low Voltage	IOUT = 3 mA, 6 mA		0.55	—	0.33	V

d_{TLH}	Capacitive Loading, LOW to HIGH		0.03		0.03		0.03		0.04		0.06	ns/pF

1. For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, point and position whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.*
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading
