Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	72
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-1plg84m

About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.

A		P			
M		P	P		
B		P	P		

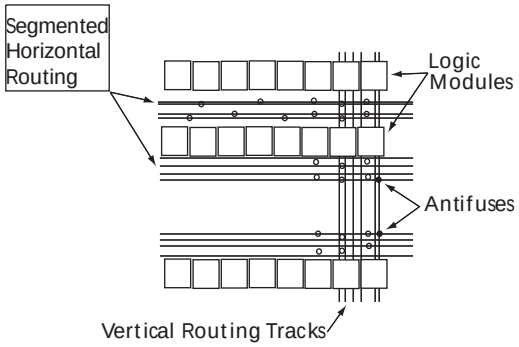
Note: See the 40MX and 42MX Automotive Family FPGAs datasheet for details on automotive-grade MX offerings.

Contact your local *Microsemi Sales representative* for device availability.

3.2.3.3 Antifuse Structures

An antifuse is a “normally open” structure. The use of antifuses to implement a programmable logic device results in highly testable structures as well as efficient programming algorithms. There are no pre-existing connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed and individual circuit structures to be tested, which can be done before and after programming. For instance, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Figure 7 • **MX Routing Structure**



3.2.4 Clock Networks

The 40MX devices have one global clock distribution network (CLK). A signal can be put on the CLK network by being routed through the CLKBUF buffer.

In 42MX devices, there are two low-skew, high-fanout clock distribution networks, referred to as CLKA and CLKB. Each network has a clock module (CLKMOD) that can select the source of the clock signal from any of the following (Figure 8, page 11):

- Externally from the CLKA pad, using CLKBUF buffer
- Externally from the CLKB pad, using CLKBUF buffer
- Internally from the CLKINTA input, using CLKINT buffer
- Internally from the CLKINTB input, using CLKINT buffer

The clock modules are located in the top row of I/O modules. Clock drivers and a dedicated horizontal clock track are located in each horizontal routing channel.

Clock input pads in both 40MX and 42MX devices can also be used as normal I/Os, bypassing the clock networks.

The A42MX36 device has four additional register control resources, called quadrant clock networks (Figure 9, page 11). Each quadrant clock provides a local, high-fanout resource to the contiguous logic modules within its quadrant of the device. Quadrant clock signals can originate from specific I/O pins or from the internal array and can be used as a secondary register clock, register clear, or output enable.

Additionally, the back-annotation flow is compatible with all the major simulators and the simulation results can be cross-probed with Silicon Explorer II, Microsemi's integrated verification and logic analysis tool. Another tool included in the Libero software is the SmartGen macro builder, which easily creates popular and commonly used logic functions for implementation into your schematic or HDL design.

Microsemi's Libero software is compatible with the most popular FPGA design entry and verification tools from companies such as Mentor Graphics, Synopsys, and Cadence design systems.

See the Libero IDE web content at www.microsemi.com/soc/products/software/libero/default.aspx for further information on licensing and current operating system support.

3.6.3 Miscellaneous

Libero IDE Flow Diagram

3.7 5.0 V Operating Conditions

The following tables show 5.0 V operating conditions.

Table 12 • **Absolute Maximum Ratings for 40MX Devices***

Symbol	Parameter	Limits	Units
VCC	DC Supply Voltage	–0.5 to +7.0	V
VI	Input Voltage	–0.5 to VCC+0.5	V
VO	Output Voltage	–0.5 to VCC+0.5	V
t_{STG}	Storage Temperature	–65 to +150	°C

Note: *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

Table 13 • **Absolute Maximum Ratings for 42MX Devices***

Symbol	Parameter	Limits	Units
VCCI	DC Supply Voltage for I/Os	–0.5 to +7.0	V
VCCA	DC Supply Voltage for Array	–0.5 to +7.0	V
VI	Input Voltage	–0.5 to VCCI+0.5	V
VO	Output Voltage	–0.5 to VCCI+0.5	V
t_{STG}	Storage Temperature	–65 to +150	°C

reliability. Devices should not be operated outside the recommended operating conditions.

Table 21 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature Range*	0 to +70	–40 to +85	–55 to +125	°C
VCCA	4.75 to 5.25	4.5 to 5.5	4.5 to 5.5	V
VCCI	3.14 to 3.47	3.0 to 3.6	3.0 to 3.6	V

Note: *Ambient temperature (T_A) is used for commercial and industrial grades; case temperature (T_C) is used for military grades.

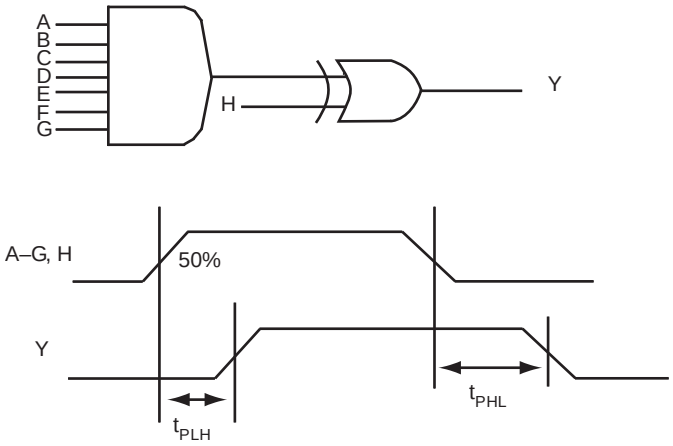
3.10.4 Decode Module Timing

The following figure shows decode module timing.

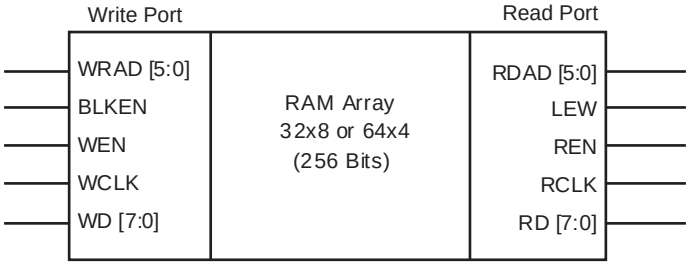
Figure 28 • **Decode Module Timing**



3.10.5 SRAM Timing Characteristics

The following figure shows SRAM timing characteristics.

Figure 29 • **SRAM Timing Characteristics**



3.10.6 Dual-Port SRAM Timing Waveforms

The following figures show dual-port SRAM timing waveforms.

Table 40 • **A42MX16 Timing Characteristics (Nominal 5.0 V Operation) *(continued)*(Worst-Case Commercial Conditions, VCCA = 4.75 V, T_J = 70°C)**

Parameter / Description		–3 Speed		–2 Speed		–1 Speed		Std Speed		–F Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
CMOS Output Module Timing[5]												
t_{DLH}	Data-to-Pad HIGH		3.2		3.6		4.0		4.7		6.6	ns
t_{DHL}	Data-to-Pad LOW		2.5		2.7		3.1		3.6		5.1	ns
t_{ENZH}	Enable Pad Z to HIGH		2.7		3.0		3.4		4.0		5.6	ns
t_{ENZL}	Enable Pad Z to LOW		3.0		3.3		3.8		4.4		6.2	ns
t_{ENHZ}	Enable Pad HIGH to Z		5.4		6.0		6.8		8.0		11.2	ns
t_{ENLZ}	Enable Pad LOW to Z		5.0		5.6		6.3		7.4		10.4	ns
t_{GLH}	G-to-Pad HIGH		5.1		5.6		6.4		7.5		10.5	ns
t_{GHL}	G-to-Pad LOW		5.1		5.6		6.4		7.5		10.5	ns
t_{LCO}	I/O Latch Clock-to-Out (Pad-to-Pad), 64 Clock Loading		5.7		6.3		7.1		8.4		11.9	ns
t_{ACO}	Array Clock-to-Out (Pad-to-Pad), 64 Clock Loading		8.0		8.9		10.1		11.9		16.7	ns
d_{TLH}	Capacitive Loading, LOW to HIGH		0.03		0.03		0.03		0.04		0.06	ns/pF

1. For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, point and position whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.*
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading

Table 41 • **A42MX16 Timing Characteristics (Nominal 3.3 V Operation) (Worst-Case Commercial Conditions, VCCA = 3.0 V, T_J = 70°C)**
