Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	83
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	100-BQFP
Supplier Device Package	100-PQFP (20x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-1pqg100i

2.3 Ordering Information

The following figure shows ordering information.All the following tables show plastic and ceramic device resources, temperature and speed grade offerings.

Figure 1 • **Ordering Information**

3.9.3 Output Drive Characteristics for 3.3 V PCI Signaling

Table 25 • **DC Specification (3.3 V PCI Signaling)[1]**

			PCI		MX		
Symbol	**Parameter**	**Condition**	**Min.**	**Max.**	**Min.**	**Max.**	**Units**
VCCI	Supply Voltage for I/Os		3.0	3.6	3.0	3.6[2]	V
VIH	Input High Voltage		0.5	VCC + 0.5	0.5	VCCI + 0.3	V
VIL	Input Low Voltage		–0.5	0.8	–0.3	0.8	V
IIH	Input High Leakage Current	VIN = 2.7 V		70		10	µA
IIL	Input Leakage Current			–70		–10	µA
VOH	Output High Voltage	IOUT = –2 mA	0.9		3.3		V
VOL	Output Low Voltage	IOUT = 3 mA, 6 mA		0.1		0.1 VCCI	V
C_{IN}	Input Pin Capacitance			10		10	pF
C_{CLK}	CLK Pin Capacitance		5	12		10	pF
L_{PIN}	Pin Inductance			20		< 8 nH[3]	nH

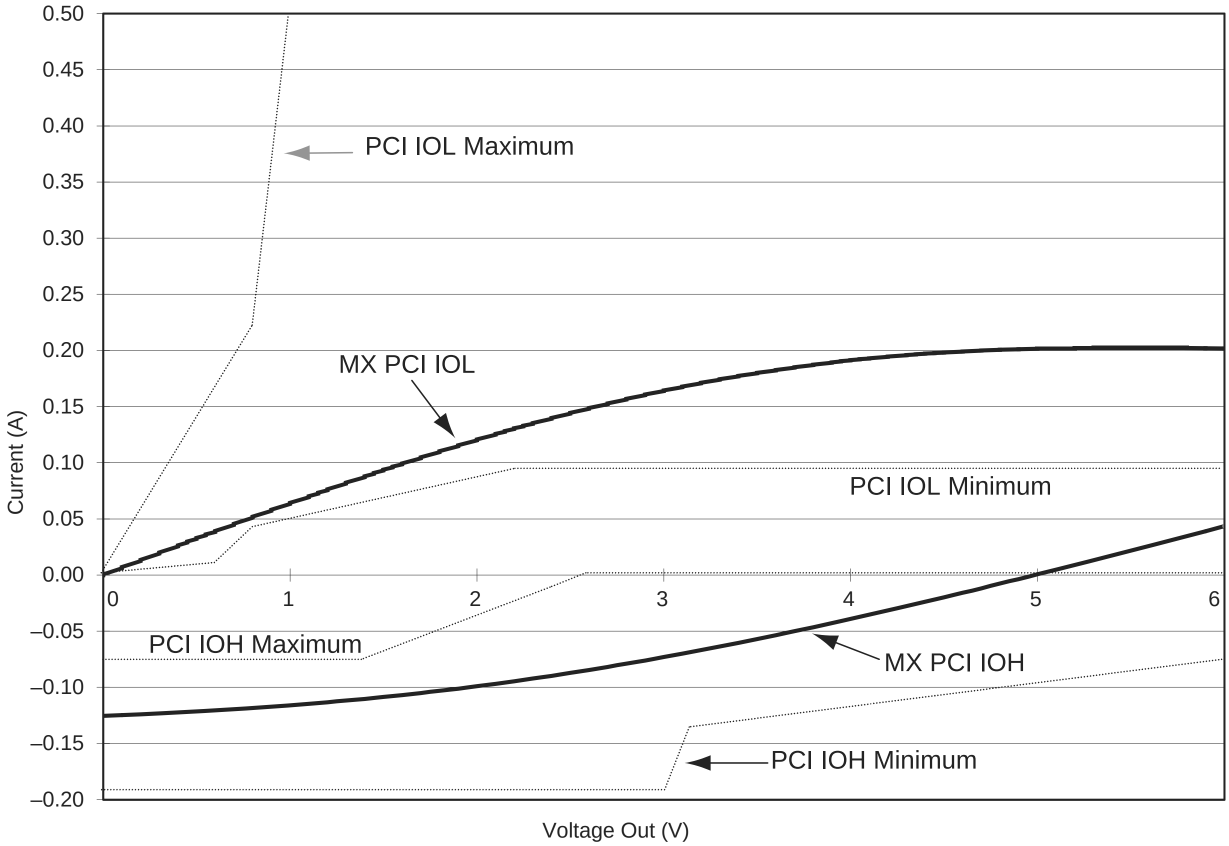
1. PCI Local Bus Specification, Version 2.1, Section 4.2.2.1.
2. Maximum rating for VCCI –0.5 V to 7.0V.
3. Dependent upon the chosen package. PCI recommends QFP and BGA packaging to reduce pin inductance and capacitance.

Table 26 • **AC Specifications for (3.3 V PCI Signaling)***

			PCI		MX		
Symbol	**Parameter**	**Condition**	**Min.**	**Max.**	**Min.**	**Max.**	**Units**
ICL	Low Clamp Current	–5 < VIN ≤ –1	–25 + (VIN +1) /0.015		–60	–10	mA
Slew (r)	Output Rise Slew Rate	0.2 V to 0.6 V load	1	4	1.8	2.8	V/ns
Slew (f)	Output Fall Slew Rate	0.6 V to 0.2 V load	1	4	2.8	4.0	V/ns

Note: *PCI Local Bus Specification, Version 2.1, Section 4.2.2.2.

Figure 16 • **Typical Output Drive Characteristics (Based Upon Measured Data)**



3.9.4 Junction Temperature (T_J)

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a (1)$$

EQ 4

where:

- T_a = Ambient Temperature
- ΔT = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$ (2)
- P = Power
- θ_{ja} = Junction to ambient of package. θ_{ja} numbers are located in Table 27, page 29.

3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is θ_{jc}, and the junction-to-ambient air characteristic is θ_{ja}. The thermal characteristics for θ_{ja} are shown with two different air flow rates.

The maximum junction temperature is 150°C.

Maximum power dissipation for commercial- and industrial-grade devices is a function of θ_{ja}.

A sample calculation of the absolute maximum power dissipation allowed for a TQ176 package at commercial temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max}\cdot\text{junction temp}\cdot(°\text{C}) - \text{Max}\cdot\text{ambient temp}\cdot(°\text{C})}{\theta_{ja}(°(\text{C}/\text{W}))} = \frac{150°\text{C} - 70°\text{C}}{(28°\text{C})/\text{W}} = 2.86\text{W}$$

EQ 5

The maximum power dissipation for military-grade devices is a function of θ_{jc}. A sample calculation of the absolute maximum power dissipation allowed for CQFP 208-pin package at military temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max}\cdot\text{junction temp}\cdot(°\text{C}) - \text{Max}\cdot\text{ambient temp}\cdot(°\text{C})}{\theta_{jc}(°(\text{C}/\text{W}))} = \frac{150°\text{C} - 125°\text{C}}{(6.3°\text{C})/\text{W}} = 3.97\text{W}$$

EQ 6

Table 27 • **Package Thermal Characteristics**

3.10.7 Predictable Performance: Tight Delay Distributions

Propagation delay between logic modules depends on the resistive and capacitive loading of the routing tracks, the interconnect elements, and the module inputs being driven. Propagation delay increases as the length of routing tracks, the number of interconnect elements, or the number of inputs increases.

From a design perspective, the propagation delay can be statistically correlated or modeled by the fanout (number of loads) driven by a module. Higher fanout usually requires some paths to have longer routing tracks.

The MX FPGAs deliver a tight fanout delay distribution, which is achieved in two ways: by decreasing the delay of the interconnect elements and by decreasing the number of interconnect elements per path.

Microsemi’s patented antifuse offers a very low resistive/capacitive interconnect. The antifuses, fabricated in 0.45 µm lithography, offer nominal levels of 100 Ω resistance and 7.0 fF capacitance per antifuse.

MX fanout distribution is also tight due to the low number of antifuses required for each interconnect path. The proprietary architecture limits the number of antifuses per path to a maximum of four, with 90 percent of interconnects using only two antifuses.

3.11 Timing Characteristics

Device timing characteristics fall into three categories: family-dependent, device-dependent, and design-dependent. The input and output buffer characteristics are common to all MX devices. Internal routing delays are device-dependent; actual delays are not determined until after place-and-route of the user's design is complete. Delay values may then be determined by using the Designer software utility or by performing simulation with post-layout delays.

3.11.1 Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most timing critical paths. Critical nets are determined by net property assignment in Microsemi's Designer software prior to placement and routing. Up to 6% of the nets in a design may be designated as critical.

3.11.2 Long Tracks

Some nets in the design use long tracks, which are special routing resources that span multiple rows, columns, or modules. Long tracks employ three and sometimes four antifuse connections, which increase capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically, up to 6 percent of nets in a fully utilized device require long tracks. Long tracks add

Table 35 • **A40MX02 Timing Characteristics (Nominal 3.3 V Operation) *(continued)* (Worst-Case Commercial Conditions, VCC = 3.0 V, T_J = 70°C)**

Parameter / Description		–3 Speed Min.	–3 Speed Max.	–2 Speed Min.	–2 Speed Max.	–1 Speed Min.	–1 Speed Max.	Std Speed Min.	Std Speed Max.	–F Speed Min.	–F Speed Max.	Units

d_{THL}	Capacity Loading, HIGH to LOW		0.05		0.05		0.06		0.07		0.10	ns/pF

1. *For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.*
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.*
4. *Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*
5. *Delays based on 35 pF loading.*

Table 40 • A42MX16 Timing Characteristics (Nominal 5.0 V Operation) (Worst-Case Commercial Conditions, VCCA = 4.75 V, T_J = 70°C)

Parameter / Description		–3 Speed		–2 Speed		–1 Speed		Std Speed		–F Speed		
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Units
Logic Module Propagation Delays[1]
