Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	83
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	100-BQFP
Supplier Device Package	100-PQFP (20x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-2pq100

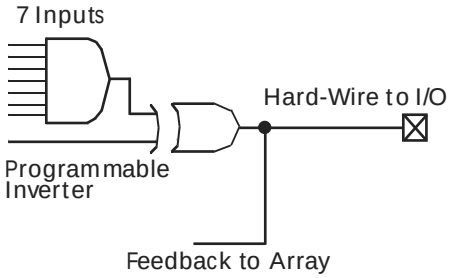

Figure 6 • **A42MX36 Dual-Port SRAM Block**

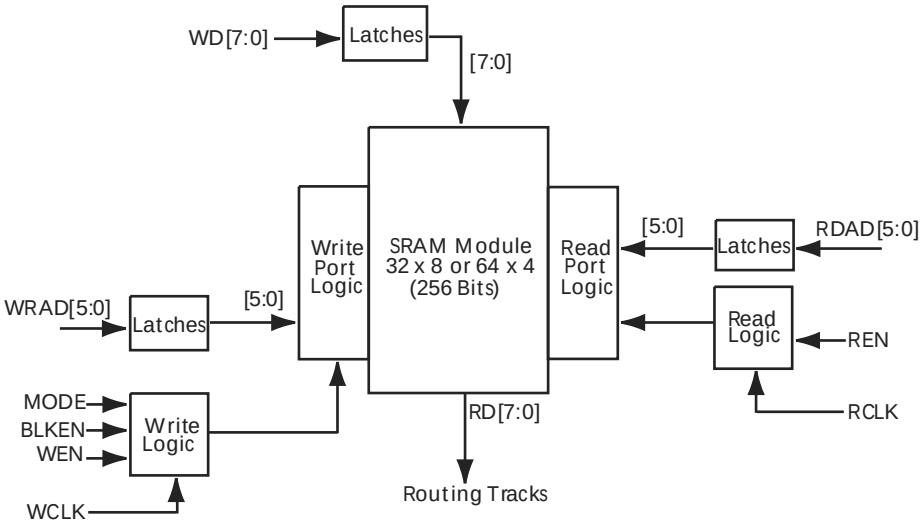


3.2.3 Routing Structure

The MX architecture uses vertical and horizontal routing tracks to interconnect the various logic and I/O modules. These routing tracks are metal interconnects that may be continuous or split into segments. Varying segment lengths allow the interconnect of over 90% of design tracks to occur with only two antifuse connections. Segments can be joined together at the ends using antifuses to increase their lengths up to the full length of the track. All interconnects can be accomplished with a maximum of four antifuses.

3.2.3.1 Horizontal Routing

Horizontal routing tracks span the whole row length or are divided into multiple segments and are located in between the rows of modules. Any segment that spans more than one-third of the row length is considered a long horizontal segment. A typical channel is shown in Figure 7, page 10. Within horizontal routing, dedicated routing tracks are used for global clock networks and for power and ground tie-off tracks. Non-dedicated tracks are used for signal nets.

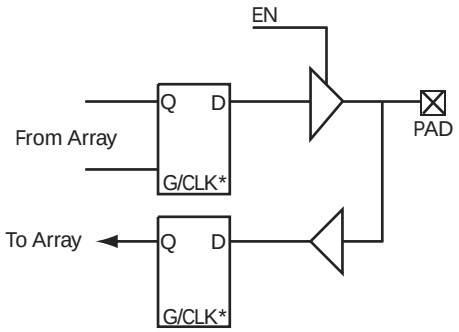
3.2.3.2 Vertical Routing

Another set of routing tracks run vertically through the module. There are three types of vertical tracks: input, output, and long. Long tracks span the column length of the module, and can be divided into multiple segments. Each segment in an input track is dedicated to the input of a particular module; each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing.

Each output segment spans four channels (two above and two below), except near the top and bottom of the array, where edge effects occur. Long vertical tracks contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 7, page 10.

Designer software development tools provide a design library of I/O macro functions that can implement all I/O configurations supported by the MX FPGAs.

Figure 10 • **42MX I/O Module**



Note: **Can be configured as a Latch or D Flip-Flop (Using C-Module)*

3.3 Other Architectural Features

The following sections cover other architectural features of 40MX and 42MX FPGAs.

3.3.1 Performance

MX devices can operate with internal clock frequencies of 250 MHz, enabling fast execution of complex logic functions. MX devices are live on power-up and do not require auxiliary configuration devices and thus are an optimal platform to integrate the functionality contained in multiple programmable logic devices. In addition, designs that previously would have required a gate array to meet performance can be integrated into an MX device with improvements in cost and time-to-market. Using timing-driven place-and-route (TDPR) tools, designers can achieve highly deterministic device performance.

3.3.2 User Security

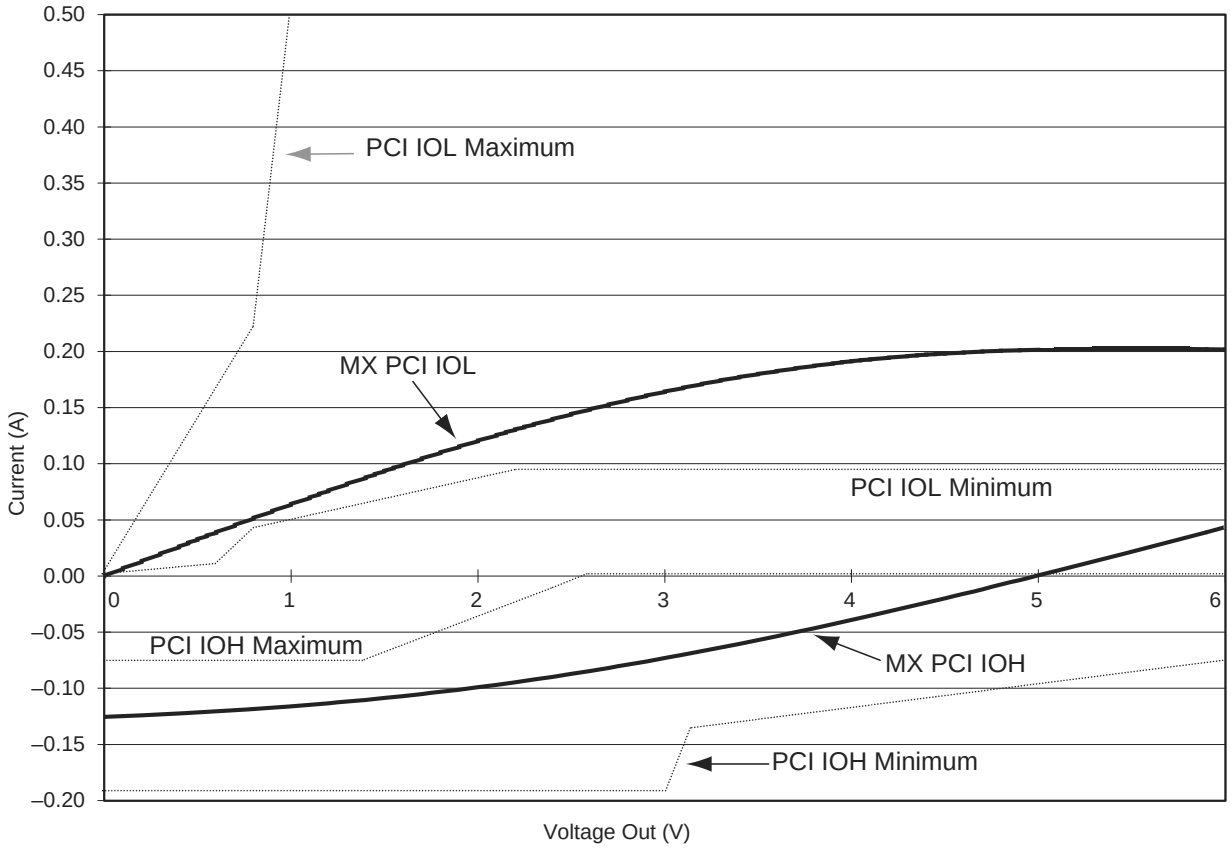
Microsemi FuseLock provides robust security against design theft. Special security fuses are hidden in the fabric of the device and protect against unauthorized users attempting to access the programming and/or probe interfaces. It is virtually impossible to identify or bypass these fuses without damaging the device, making Microsemi antifuse FPGAs protected with the highest level of security available from both invasive and noninvasive attacks.

Special security fuses in 40MX devices include the Probe Fuse and Program Fuse. The former disables the probing circuitry while the latter prohibits further programming of all fuses, including the Probe Fuse. In 42MX devices, there is the Security Fuse which, when programmed, both disables the probing circuitry and prohibits further programming of the device.

3.3.3 Programming

Device programming is supported through the Silicon Sculptor series of programmers. Silicon Sculptor is a compact, robust, single-site and multi-site device programmer for the PC. With standalone software, Silicon Sculptor is designed to allow concurrent programming of multiple units from the same PC.

Figure 16 • **Typical Output Drive Characteristics (Based Upon Measured Data)**



3.9.4 Junction Temperature (T_J)

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a \quad (1)$$

EQ 4

where:

- T_a = Ambient Temperature
- ΔT = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$ (2)
- P = Power
- θ_{ja} = Junction to ambient of package. θ_{ja} numbers are located in Table 27, page 29.

3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is θ_{jc}, and the junction-to-ambient air characteristic is θ_{ja}. The thermal characteristics for θ_{ja} are shown with two different air flow rates.

The maximum junction temperature is 150°C.

Maximum power dissipation for commercial- and industrial-grade devices is a function of θ_{ja}.

1. For dual-module macros use tPD1 + tRD1 + taped, to + tRD1 + taped, or tPD1 + tRD1 + tusk, whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing ansalysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading.
