

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	101
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-2pq160

1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

1.1 Revision 15.0

The following is a summary of the changes in revision 15.0 of this document.

- Table 15, page 21 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
- Table 22, page 25 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
- Table 23, page 25 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V

1.2 Revision 14.0

The following is a summary of the changes in revision 14.0 of this document.

- Added CQFP package information for A42MX16 device in Product Profile, page 1 and Ceramic Device Resources, page 4 (SAR 79522).
- Added Military (M) and MIL-STD-883 Class B (B) grades for CPGA 132 Package and added Commercial (C), Military (M), and MIL-STD-883 Class B (B) grades for CQFP 172 Package in Temperature Grade Offerings, page 5 (SAR 79519)
- Changed Silicon Sculptor II to Silicon Sculptor in Programming, page 12 (SAR 38754)
- Added Figure 53, page 158 CQ172 package (SAR 79522).

1.3 Revision 13.0

The following is a summary of the changes in revision 13.0 of this document.

- Added Figure 42, page 97 PQ144 Package for A42MX09 device (SAR 69776)
- Added Figure 52, page 153 PQ132 Package for A42MX09 device (SAR 69776)

1.4 Revision 12.0

The following is a summary of the changes in revision 12.0 of this document.

- Added information on power-up behavior for A42MX24 and A42MX36 devices to the Power Supply, page 13 (SAR 42096)
- Corrected the inadvertent mistake in the naming of the PL68 pin assignment table (SARs 48999, 49793)

1.5 Revision 11.0

The following is a summary of the changes in revision 11.0 of this document.

- The FuseLock logo and accompanying text was removed from the User Security, page 12. This marking is no longer used on Microsemi devices (PCN 0915)
- The Development Tool Support, page 19 was updated (SAR 38512)

1.6 Revision 10.0

The following is a summary of the changes in revision 10.0 of this document.

- Ordering Information, page 3 was updated to include lead-free package ordering codes (SAR 21968)
- The User Security, page 12 was revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34673)

2.6 Temperature Grade Offerings

Table 4 • Temperature Grade Offerings

Package	A40MX02	A40MX04	A42MX09	A42MX16	A42MX24	A42MX36
PLCC 44	C, I, M	C, I, M				
PLCC 68	C, I, A, M	C, I, M

I		P	P	P	P
A		P			
M		P	P		
B		P	P		

Note: See the 40MX and 42MX Automotive Family FPGAs datasheet for details on automotive-grade MX offerings.

Contact your local *Microsemi Sales representative* for device availability.

3.2.3.3 Antifuse Structures

An antifuse is a “normally open” structure. The use of antifuses to implement a programmable logic device results in highly testable structures as well as efficient programming algorithms. There are no pre-existing connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed and individual circuit structures to be tested, which can be done before and after programming. For instance, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Figure 7 • MX Routing Structure

3.2.4 Clock Networks

The 40MX devices have one global clock distribution network (CLK). A signal can be put on the CLK network by being routed through the CLKBUF buffer.

In 42MX devices, there are two low-skew, high-fanout clock distribution networks, referred to as CLKA and CLKB. Each network has a clock module (CLKMOD) that can select the source of the clock signal from any of the following (Figure 8, page 11):

- Externally from the CLKA pad, using CLKBUF buffer
- Externally from the CLKB pad, using CLKBUF buffer
- Internally from the CLKINTA input, using CLKINT buffer
- Internally from the CLKINTB input, using CLKINT buffer

The clock modules are located in the top row of I/O modules. Clock drivers and a dedicated horizontal clock track are located in each horizontal routing channel.

Clock input pads in both 40MX and 42MX devices can also be used as normal I/Os, bypassing the clock networks.

The A42MX36 device has four additional register control resources, called quadrant clock networks (Figure 9, page 11). Each quadrant clock provides a local, high-fanout resource to the contiguous logic modules within its quadrant of the device. Quadrant clock signals can originate from specific I/O pins or from the internal array and can be used as a secondary register clock, register clear, or output enable.

Figure 8 • Clock Networks of 42MX Devices**Figure 9 • Quadrant Clock Network of A42MX36 Devices**

Note: *QCLK1IN, QCLK2IN, QCLK3IN, and QCLK4IN are internally-generated signals.

3.2.5 MultiPlex I/O Modules

42MX devices feature Multiplex I/Os and support 5.0 V, 3.3 V, and mixed 3.3 V/5.0 V operations.

The MultiPlex I/O modules provide the interface between the device pins and the logic array. Figure 10, page 12 is a block diagram of the 42MX I/O module. A variety of user functions, determined by a library macro selection, can be implemented in the module. (See the *Antifuse Macro Library Guide* for more information.) All 42MX I/O modules contain tristate buffers, with input and output latches that can be configured for input, output, or bidirectional operation.

All 42MX devices contain flexible I/O structures, where each output pin has a dedicated output-enable control (Figure 10, page 12). The I/O module can be used to latch input or output data, or both, providing fast set-up time. In addition, the Designer software tools can build a D-type flip-flop using a C-module combined with an I/O module to register input and output signals. See the *Antifuse Macro Library Guide* for more details.

A42MX24 and A42MX36 devices also offer selectable PCI output drives, enabling 100% compliance with version 2.1 of the PCI specification. For low-power systems, all inputs and outputs are turned off to reduce current consumption to below 500 μ A.

To achieve 5.0 V or 3.3 V PCI-compliant output drives on A42MX24 and A42MX36 devices, a chip-wide PCI fuse is programmed via the Device Selection Wizard in the Designer software (Figure 11, page 12). When the PCI fuse is not programmed, the output drive is standard.

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • 42MX IEEE 1149.1 Boundary Scan Circuitry

Table 9 • Test Access Port Descriptions

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • Supported BST Public Instructions

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

3.9.1 Mixed 5.0V/3.3V Electrical Specifications

Table 22 • Mixed 5.0V/3.3V Electrical Specifications

Symbol	Parameter	Commercial		Commercial –F		Industrial		Military		Units

I/O I/O source sink current Can be derived from the <i>IBIS model</i> (http://www.microsemi.com/soc/techdocs/models/ibis.html)										

1. Only one output tested at a time. VCCI = min.

2. VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V

3. All outputs unloaded. All inputs = VCCI or GND

3.9.2 Output Drive Characteristics for 5.0 V PCI Signaling

MX PCI device I/O drivers were designed specifically for high-performance PCI systems. Figure 16, page 28 shows the typical output drive characteristics of the MX devices. MX output drivers are compliant with the PCI Local Bus Specification.

Table 23 • DC Specification (5.0 V PCI Signaling)¹

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
VCCI	Supply Voltage for I/Os		4.75	5.25	4.75	5.25 ²	V
VIH ³	Input High Voltage		2.0	VCC + 0.5	2.0	VCCI + 0.3	V
VIL	Input Low Voltage		–0.5	0.8	–0.3	0.8	V
I _{IH}	Input High Leakage Current	VIN = 2.7 V		70	—	10	μA
I _{IL}	Input Low Leakage Current	VIN = 0.5 V		–70	—	–10	μA
VOH	Output High Voltage	I _{OUT} = –2 mA I _{OUT} = –6 mA	2.4		3.84		V
VOL	Output Low Voltage	I _{OUT} = 3 mA, 6 mA		0.55	—	0.33	V

3.9.3 Output Drive Characteristics for 3.3 V PCI Signaling

Table 25 • DC Specification (3.3 V PCI Signaling)¹

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
VCCI	Supply Voltage for I/Os		3.0	3.6	3.0	3.6 ²	V
VIH	Input High Voltage		0.5	VCC + 0.5	0.5	VCCI + 0.3	V
VIL	Input Low Voltage		−0.5	0.8	−0.3	0.8	V
IIH	Input High Leakage Current	VIN = 2.7 V		70		10	μA
IIL	Input Leakage Current			−70		−10	μA
VOH	Output High Voltage	IOUT = −2 mA	0.9		3.3		V
VOL	Output Low Voltage	IOUT = 3 mA, 6 mA		0.1		0.1 VCCI	V
CIN	Input Pin Capacitance			10		10	pF
CLK	CLK Pin Capacitance		5	12		10	pF
L _{PIN}	Pin Inductance			20		< 8 nH ³	nH

1. PCI Local Bus Specification, Version 2.1, Section 4.2.2.1.

2. Maximum rating for VCCI −0.5 V to 7.0V.

3. Dependent upon the chosen package. PCI recommends QFP and BGA packaging to reduce pin inductance and capacitance.

Table 26 • AC Specifications for (3.3 V PCI Signaling)*

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
ICL	Low Clamp Current	−5 < VIN ≤ −1	−25 + (VIN + 1) / 0.015		−60	−10	mA
Slew (r)	Output Rise Slew Rate	0.2 V to 0.6 V load	1	4	1.8	2.8	V/ns
Slew (f)	Output Fall Slew Rate	0.6 V to 0.2 V load	1	4	2.8	4.0	V/ns

t _{LCO}	I/O Latch Clock-to-Out (Pad-to-Pad), 64 Clock Loading			8.0		8.9		10.1		11.9		16.7	ns

Clock signal to shift the Boundary Scan Test (BST) data into the device. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDI, I/O Test Data In

Serial data input for BST instructions and data. Data is shifted in on the rising edge of TCK. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDO, I/O Test Data Out

Serial data output for BST instructions and test data. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TMS, I/O Test Mode Select

The TMS pin controls the use of the IEEE 1149.1 Boundary Scan pins (TCK, TDI, TDO). In flexible mode when the TMS pin is set LOW, the TCK, TDI and TDO pins are boundary scan pins. Once the boundary scan pins are in test mode, they will remain in that mode until the internal boundary scan state machine reaches the "logic reset" state. At this point, the boundary scan pins will be released and will function as regular I/O pins. The "logic reset" state is reached 5 TCK cycles after the TMS pin is set HIGH. In dedicated test mode, TMS functions as specified in the IEEE 1149.1 specifications. IEEE JTAG specification recommends a 10k Ω pull-up resistor on the pin. BST pins are only available in A42MX24 and A42MX36 devices.

VCC, Supply Voltage

Input supply voltage for 40MX devices

VCCA, Supply Voltage

Supply voltage for array in 42MX devices

VCCI, Supply Voltage

Supply voltage for I/Os in 42MX devices

WD, I/O Wide Decode Output

When a wide decode module is used in a 42MX device this pin can be used as a dedicated output from the wide decode module. This direct connection eliminates additional interconnect delays associated with regular logic modules. To implement the direct I/O connection, connect an output buffer of any type to the output of the wide decode macro and place this output on one of the reserved WD pins.
