### [Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### 3.9.4 Junction Temperature ( $T_J$ )

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a(1)$$

EQ 4

where:

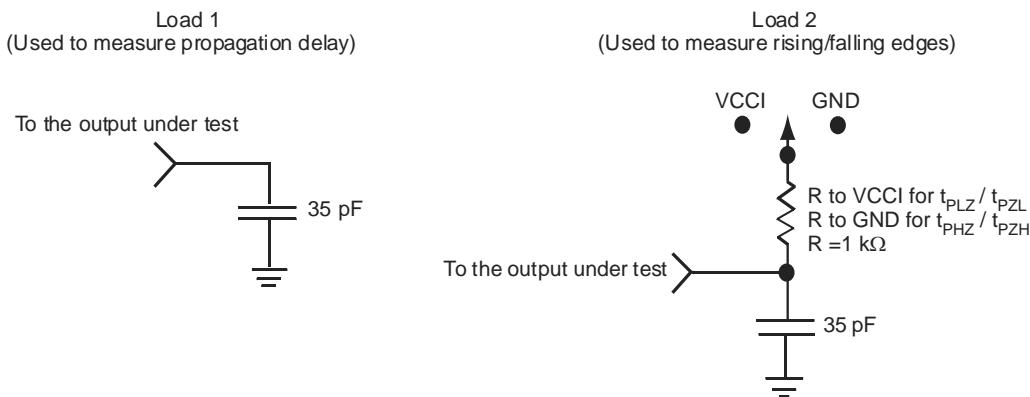

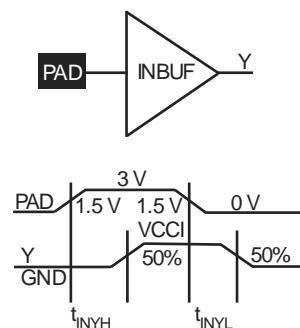

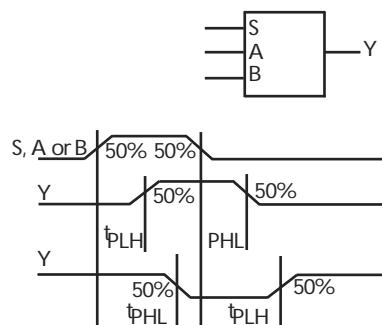

- $T_a$  = Ambient Temperature
- $\Delta T$  = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$  (2)
- $P$  = Power
- $\theta_{ja}$  = Junction to ambient of package.  $\theta_{ja}$  numbers are located in Table 27, page 29.

### 3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is  $\theta_{jc}$ , and the junction-to-ambient air characteristic is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown with two different air flow rates.

The maximum junction temperature is 150°C.

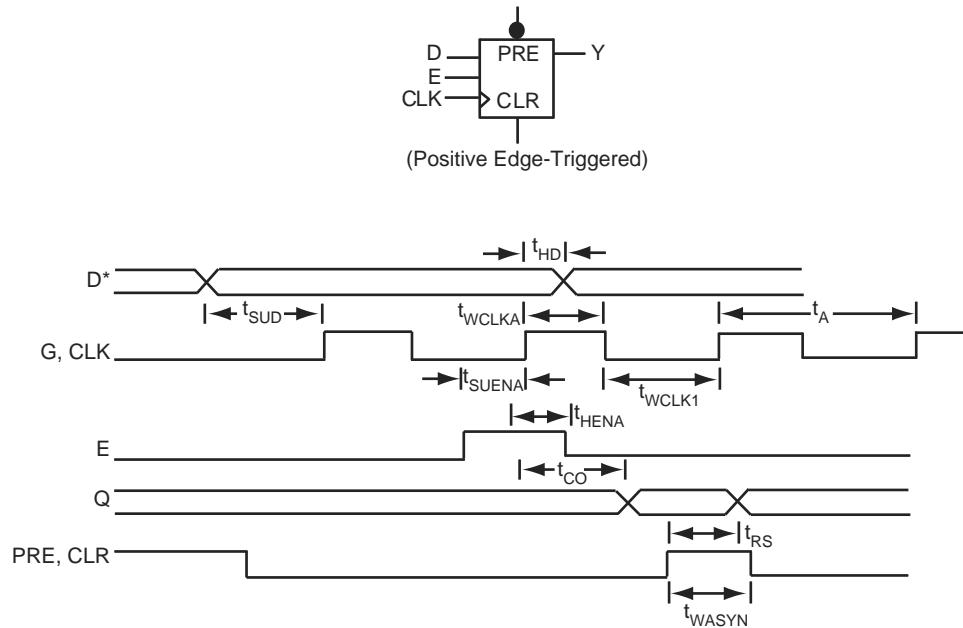

Maximum power dissipation for commercial- and industrial-grade devices is a function of  $\theta_{ja}$ .
