Microchip Technology - A42MX09-3PLG84 Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	72
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-3plg84

- The Transient Current, page 13 is new (SAR 36930).
- Package names were revised according to standards established in *Package Mechanical Drawings* (SAR 34774)

1.7 Revision 9.0

The following is a summary of the changes in revision 9.0 of this document

- In Table 20, page 23, the limits in VI were changed from -0.5 to VCCI + 0.5 to -0.5 to VCCA + 0.5

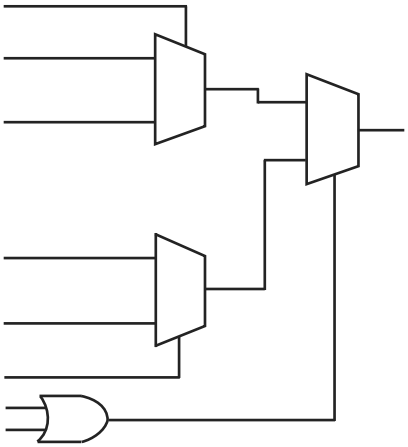
In Table 22, page 25, V_{OH} was changed from 3.7 to 2.4 for the min in industrial and military. V_{IH} had V_{CCI} and that was changed to VCCA

1.8 Revision 6.0

The following is a summary of the changes in revision 6.0 of this document.

- The Ease of Integration, page 1 was updated
- The Temperature Grade Offerings, page 5 is new
- The Speed Grade Offerings, page 5 is new
- The General Description, page 6 was updated
- The MultiPlex I/O Modules, page 11 was updated
- The User Security, page 12 was updated
- Table 6, page 13 was updated
- The Power Dissipation, page 14 was updated.
- The Static Power Component, page 14 was updated
- The Equivalent Capacitance, page 15 was updated
- Figure 13, page 17 was updated
- Table 10, page 18 was updated.
- Figure 14, page 18 was updated.
- Table 11, page 19 was updated.

Figure 2 • **42MX C-Module Implementation**



The 42MX devices contain three types of logic modules: combinatorial (C-modules), sequential (S-modules) and decode (D-modules). The following figure illustrates the combinatorial logic module. The S-module, shown in Figure 4, page 8, implements the same combinatorial logic function as the C-module while adding a sequential element. The sequential element can be configured as either a D-flip-flop or a transparent latch. The S-module register can be bypassed so that it implements purely combinatorial logic.

Figure 3 • **42MX C-Module Implementation**

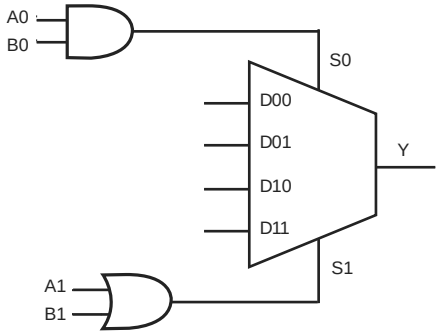


Figure 4 • **42MX S-Module Implementation**

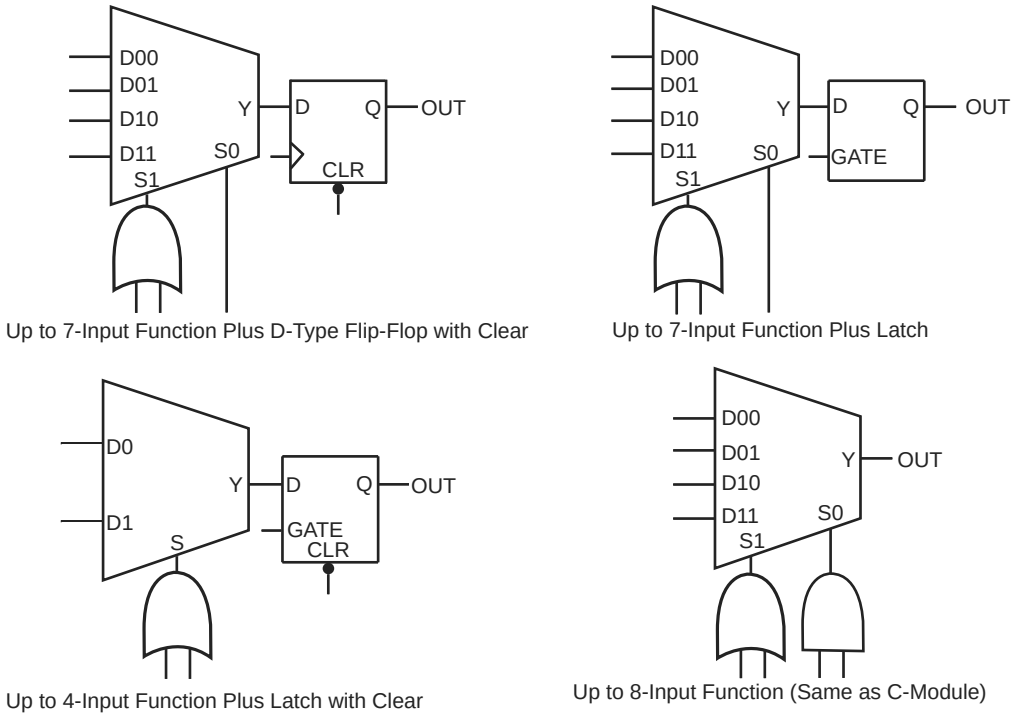

A42MX24 and A42MX36 devices contain D-modules, which are arranged around the periphery of the device. D-modules contain wide-decode circuitry, providing a fast, wide-input AND function similar to that found in CPLD architectures (Figure 5, page 9). The D-module allows A42MX24 and A42MX36 devices to perform wide-decode functions at speeds comparable to CPLDs and PALs. The output of the D-module has a programmable inverter for active HIGH or LOW assertion. The D-module output is hardwired to an output pin, and can also be fed back into the array to be incorporated into other logic.

3.2.2 Dual-Port SRAM Modules

The A42MX36 device contains dual-port SRAM modules that have been optimized for synchronous or asynchronous applications. The SRAM modules are arranged in 256-bit blocks that can be configured as 32x8 or 64x4. SRAM modules can be cascaded together to form memory spaces of user-definable width and depth. A block diagram of the A42MX36 dual-port SRAM block is shown in Figure 6, page 9.

The A42MX36 SRAM modules are true dual-port structures containing independent read and write ports. Each SRAM module contains six bits of read and write addressing (RDAD[5:0] and WRAD[5:0], respectively) for 64x4-bit blocks. When configured in byte mode, the highest order address bits (RDAD5 and WRAD5) are not used. The read and write ports of the SRAM block contain independent clocks (RCLK and WCLK) with programmable polarities offering active HIGH or LOW implementation. The SRAM block contains eight data inputs (WD[7:0]), and eight outputs (RD[7:0]), which are connected to segmented vertical routing tracks.

The A42MX36 dual-port SRAM blocks provide an optimal solution for high-speed buffered applications requiring FIFO and LIFO queues. The ACTgen Macro Builder within Microsemi's designer software provides capability to quickly design memory functions with the SRAM blocks. Unused SRAM blocks can be used to implement registers for other user logic within the design.

3.3.7 Low Power Mode

42MX devices have been designed with a Low Power Mode. This feature, activated with setting the special LP pin to HIGH for a period longer than 800 ns, is particularly useful for battery-operated systems where battery life is a primary concern. In this mode, the core of the device is turned off and the device consumes minimal power with low standby current. In addition, all input buffers are turned off, and all outputs and bidirectional buffers are tristated. Since the core of the device is turned off, the states of the registers are lost. The device must be re-initialized when exiting Low Power Mode. I/Os can be driven during LP mode, and clock pins should be driven HIGH or LOW and should not float to avoid drawing current. To exit LP mode, the LP pin must be pulled LOW for over 200 µs to allow for charge pumps to power up, and device initialization will begin.

3.4 Power Dissipation

The general power consumption of MX devices is made up of static and dynamic power and can be expressed with the following equation.

3.4.1 General Power Equation

$$P = [ICCstandby + ICCactive]*VCCI + IOL*VOL*N + IOH*(VCCI - VOH)*M$$

EQ 1

where:

- ICCstandby is the current flowing when no inputs or outputs are changing.
- ICCactive is the current flowing due to CMOS switching.
- IOL, IOH are TTL sink/source currents.
- VOL, VOH are TTL level output voltages.
- N equals the number of outputs driving TTL loads to VOL.
- M equals the number of outputs driving TTL loads to VOH.

Accurate values for N and M are difficult to determine because they depend on the family type, on design details, and on the system I/O. The power can be divided into two components: static and active.

3.4.2 Static Power Component

The static power due to standby current is typically a small component of the overall power consumption. Standby power is calculated for commercial, worst-case conditions. The static power dissipation by TTL loads depends on the number of outputs driving, and on the DC load current. For instance, a 32-bit bus sinking 4mA at 0.33V will generate 42mW with all outputs driving LOW, and 140mW with all outputs driving HIGH. The actual dissipation will average somewhere in between, as I/Os switch states with time.

3.4.3 Active Power Component

Power dissipation in CMOS devices is usually dominated by the dynamic power dissipation. Dynamic power consumption is frequency-dependent and is a function of the logic and the external I/O. Active power dissipation results from charging internal chip capacitances of the interconnect, unprogrammed antifuses, module inputs, and module outputs, plus external capacitances due to PC board traces and load device inputs. An additional component of the active power dissipation is the totem pole current in the CMOS transistor pairs. The net effect can be associated with an equivalent capacitance that can be combined with frequency and voltage to represent active power dissipation.

The power dissipated by a CMOS circuit can be expressed by the equation:

$$Power(\mu W) = C_{EQ} * VCCA2 * F(1)$$

EQ 2

where:

- C_{EQ} = Equivalent capacitance expressed in picofarads (pF)

f_{q2} = Average second routed array clock rate in MHz)

Table 7 • **Fixed Capacitance Values for MX FPGAs (pF)**

Device Type	r1 routed_Clk1	r2 routed_Clk2
A40MX02	41.4	N/A
A40MX04	68.6	N/A
A42MX09	118	118
A42MX16	165	165
A42MX24	185	185
A42MX36	220	220

3.4.6 Test Circuitry and Silicon Explorer II Probe

MX devices contain probing circuitry that provides built-in access to every node in a design, via the use of Silicon Explorer II. Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer software, allow users to examine any of the internal nets of the device while it is operating in a prototyping or a production system. The user can probe into an MX device without changing the placement and routing of the design and without using any additional resources. Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle and providing a true representation of the device under actual functional situations.

Silicon Explorer II samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

Silicon Explorer II is used to control the MODE, DCLK, SDI and SDO pins in MX devices to select the desired nets for debugging. The user simply assigns the selected internal nets in the Silicon Explorer II software to the PRA/PRB output pins for observation. Probing functionality is activated when the MODE pin is held HIGH.

Figure 12, page 16 illustrates the interconnection between Silicon Explorer II and 40MX devices, while Figure 13, page 17 illustrates the interconnection between Silicon Explorer II and 42MX devices

To allow for probing capabilities, the security fuses must not be programmed. (See User Security, page 12 for the security fuses of 40MX and 42MX devices). Table 8, page 17 summarizes the possible device configurations for probing.

PRA and PRB pins are dual-purpose pins. When the “Reserve Probe Pin” is checked in the Designer software, PRA and PRB pins are reserved as dedicated outputs for probing. If PRA and PRB pins are required as user I/Os to achieve successful layout and “Reserve Probe Pin” is checked, the layout tool will override the option and place user I/Os on PRA and PRB pins.
