Microchip Technology - A42MX09-3PQ100I Datasheet

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	83
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	100-BQFP
Supplier Device Package	100-PQFP (20x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-3pq100i

Figure 8 • **Clock Networks of 42MX Devices**

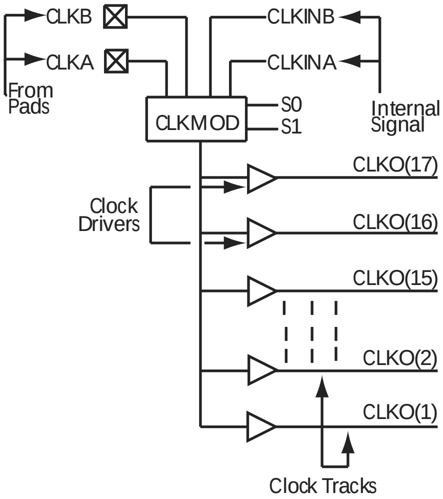

Figure 9 • **Quadrant Clock Network of A42MX36 Devices**

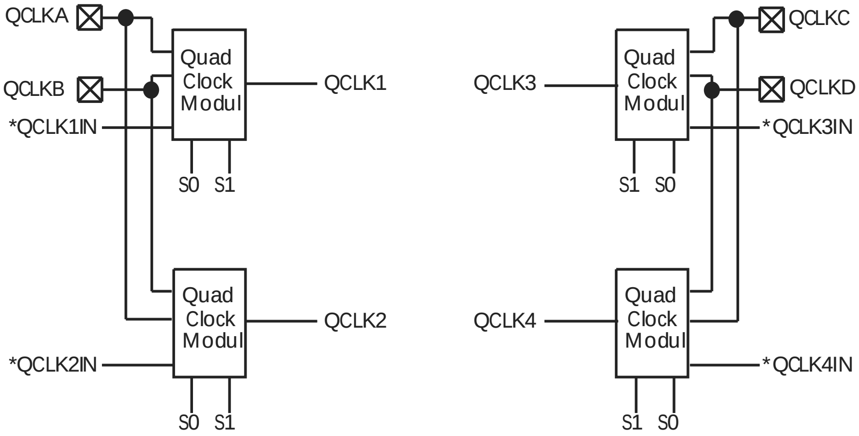

Note: *QCLK1IN, QCLK2IN, QCLK3IN, and QCLK4IN are internally-generated signals.

3.2.5 MultiPlex I/O Modules

42MX devices feature Multiplex I/Os and support 5.0 V, 3.3 V, and mixed 3.3 V/5.0 V operations.

The MultiPlex I/O modules provide the interface between the device pins and the logic array. Figure 10, page 12 is a block diagram of the 42MX I/O module. A variety of user functions, determined by a library macro selection, can be implemented in the module. (See the *Antifuse Macro Library Guide* for more information.) All 42MX I/O modules contain tristate buffers, with input and output latches that can be configured for input, output, or bidirectional operation.

All 42MX devices contain flexible I/O structures, where each output pin has a dedicated output-enable control (Figure 10, page 12). The I/O module can be used to latch input or output data, or both, providing fast set-up time. In addition, the Designer software tools can build a D-type flip-flop using a C-module combined with an I/O module to register input and output signals. See the *Antifuse Macro Library Guide* for more details.

A42MX24 and A42MX36 devices also offer selectable PCI output drives, enabling 100% compliance with version 2.1 of the PCI specification. For low-power systems, all inputs and outputs are turned off to reduce current consumption to below 500 µA.

To achieve 5.0 V or 3.3 V PCI-compliant output drives on A42MX24 and A42MX36 devices, a chip-wide PCI fuse is programmed via the Device Selection Wizard in the Designer software (Figure 11, page 12). When the PCI fuse is not programmed, the output drive is standard.

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • **42MX IEEE 1149.1 Boundary Scan Circuitry**

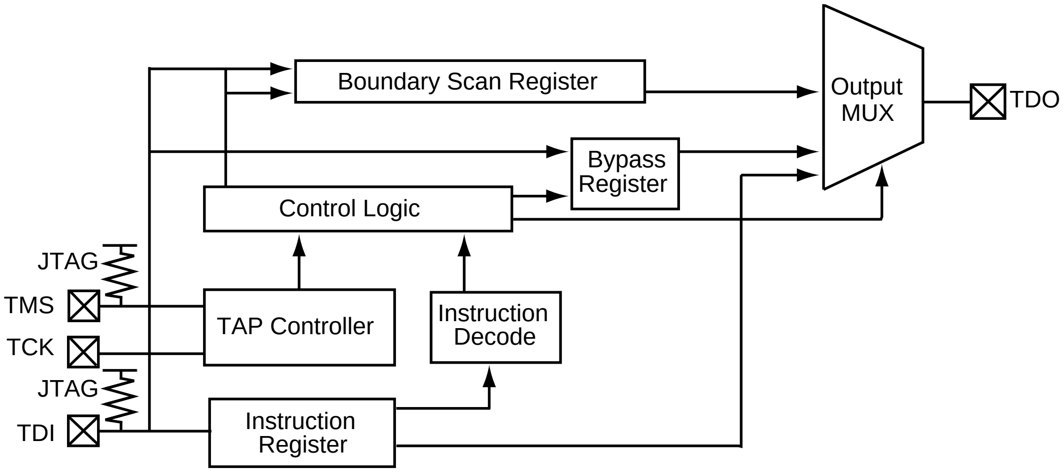

Table 9 • **Test Access Port Descriptions**

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • **Supported BST Public Instructions**

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

3. All outputs unloaded. All inputs = VCC/VCCI or GND

3.8 3.3 V Operating Conditions

The following table shows 3.3 V operating conditions.

Table 16 • **Absolute Maximum Ratings for 40MX Devices***

Symbol	Parameter	Limits	Units
VCC	DC Supply Voltage	–0.5 to +7.0	V
VI	Input Voltage	–0.5 to VCC + 0.5	V
VO	Output Voltage	–0.5 to VCC + 0.5	V
t_{STG}	Storage Temperature	–65 to + 150	°C

Note: *Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

Table 17 • **Absolute Maximum Ratings for 42MX Devices***

Symbol	Parameter	Limits	Units
VCCI	DC Supply Voltage for I/Os	–0.5 to +7.0	V
VCCA	DC Supply Voltage for Array	–0.5 to +7.0	V
VI	Input Voltage	–0.5 to VCCI+0.5	V
VO	Output Voltage	–0.5 to VCCI+0.5	V
t_{STG}	Storage Temperature	–65 to +150	°C

Note: *Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

Table 18 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature Range*	0 to +70	–40 to +85	–55 to +125	°C
VCC (40MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VCCA (42MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VCCI (42MX)	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V

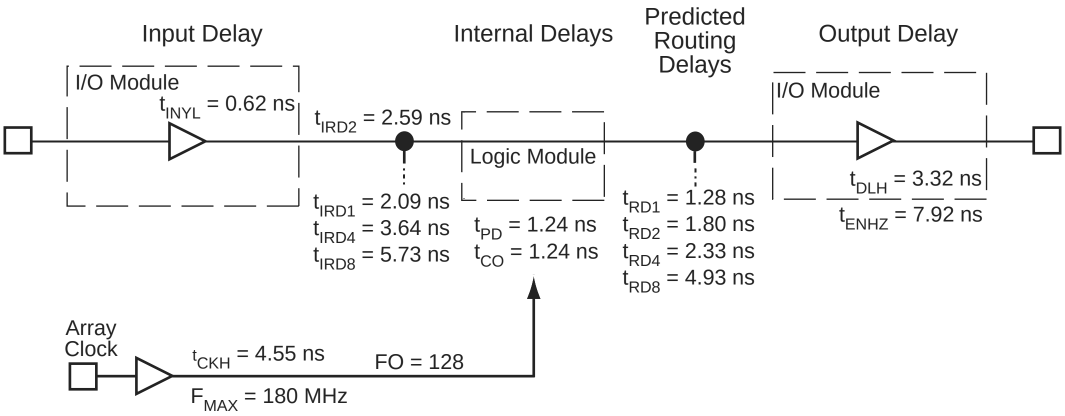
Note: *Ambient temperature (T_A) is used for commercial and industrial grades; case temperature (T_C) is used for military grades.

All the following tables show various specifications and operating conditions of 40MX and 42MX FPGAs.

3.10 Timing Models

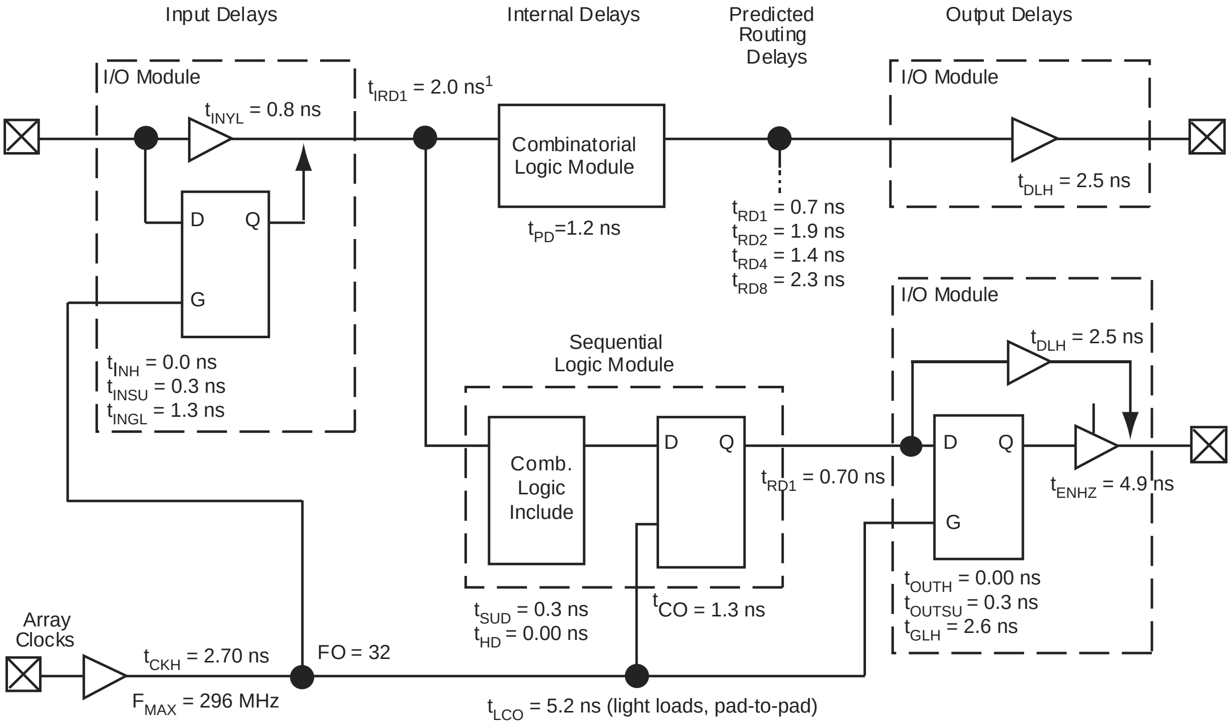
The following figures show various timing models.

Figure 17 • **40MX Timing Model***



Note: Values are shown for 40MX –3 speed devices at 5.0 V worst-case commercial conditions.

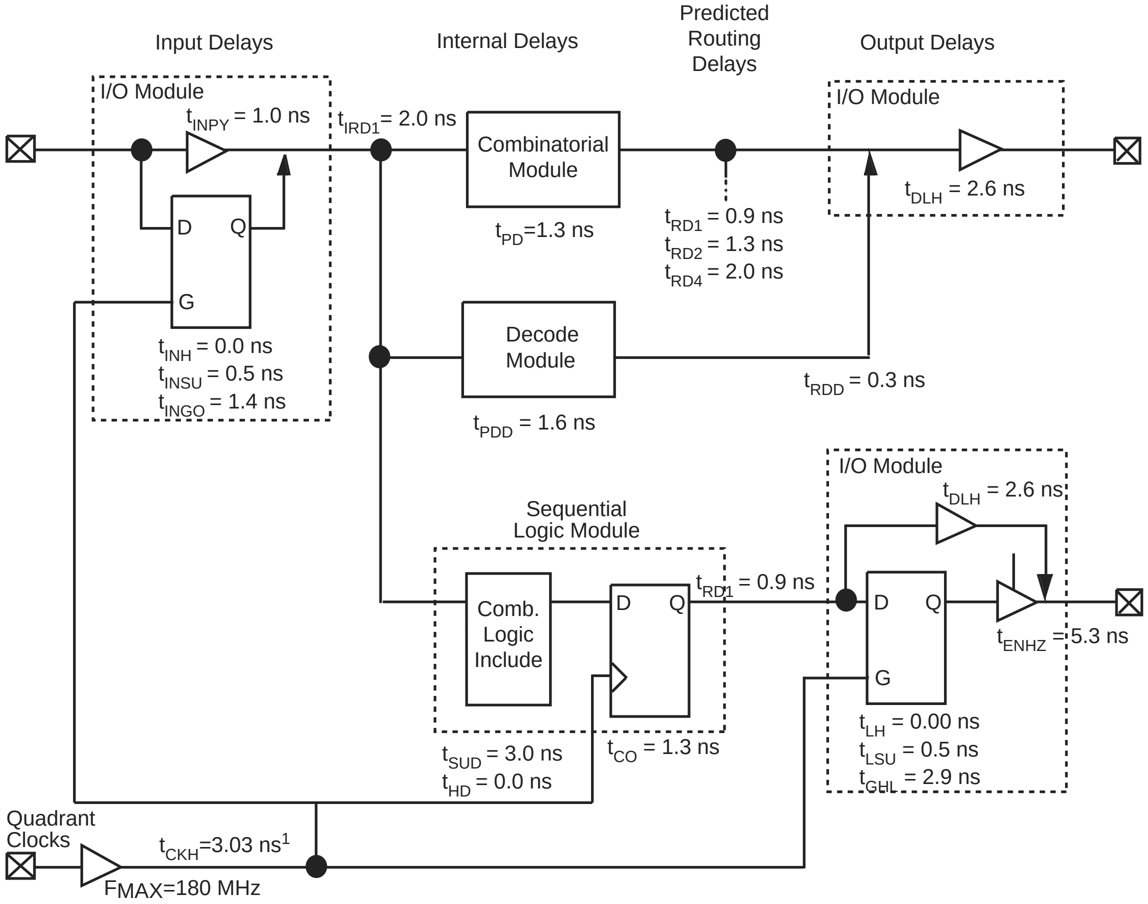
Figure 18 • **42MX Timing Model**



Note: 1. Input module predicted routing delay

Note: 2. Values are shown for A42MX09 –3 at 5.0 V worst-case commercial conditions.

Figure 19 • **42MX Timing Model (Logic Functions Using Quadrant Clocks)**



Note: 1. Load-dependent

Note: 2. Values are shown for A42MX36 –3 at 5.0 V worst-case commercial conditions

1. *For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.*
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.*
4. *Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*
5. *Delays based on 35 pF loading.*
