

Welcome to [E-XFL.COM](#)

Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

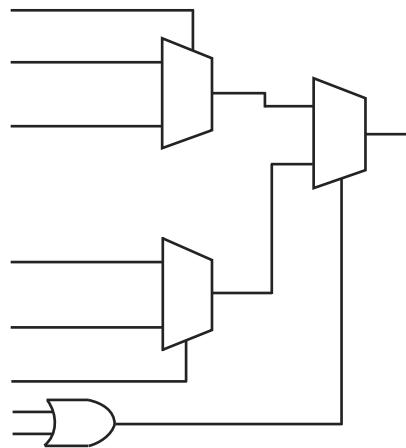

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

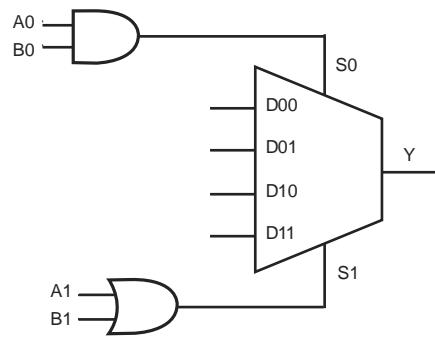

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	101
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-3pq160i

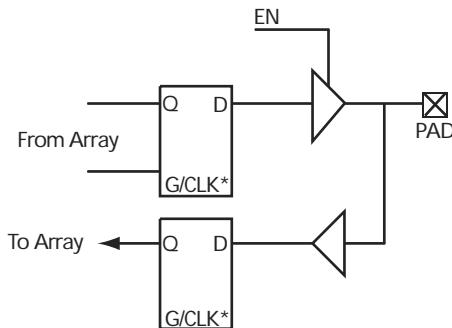

Figure 2 • 42MX C-Module Implementation

The 42MX devices contain three types of logic modules: combinatorial (C-modules), sequential (S-modules) and decode (D-modules). The following figure illustrates the combinatorial logic module. The S-module, shown in Figure 4, page 8, implements the same combinatorial logic function as the C-module while adding a sequential element. The sequential element can be configured as either a D-flip-flop or a transparent latch. The S-module register can be bypassed so that it implements purely combinatorial logic.

Figure 3 • 42MX C-Module Implementation

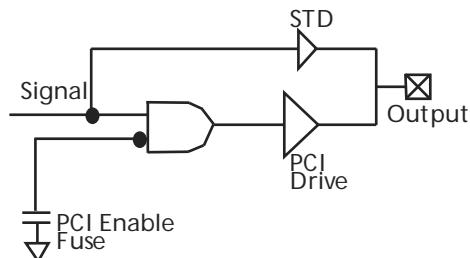

Designer software development tools provide a design library of I/O macro functions that can implement all I/O configurations supported by the MX FPGAs.

Figure 10 • 42MX I/O Module

Note: *Can be configured as a Latch or D Flip-Flop (Using C-Module)

Figure 11 • PCI Output Structure of A42MX24 and A42MX36 Devices

3.3 Other Architectural Features

The following sections cover other architectural features of 40MX and 42MX FPGAs.

3.3.1 Performance

MX devices can operate with internal clock frequencies of 250 MHz, enabling fast execution of complex logic functions. MX devices are live on power-up and do not require auxiliary configuration devices and thus are an optimal platform to integrate the functionality contained in multiple programmable logic devices. In addition, designs that previously would have required a gate array to meet performance can be integrated into an MX device with improvements in cost and time-to-market. Using timing-driven place-and-route (TDPR) tools, designers can achieve highly deterministic device performance.

3.3.2 User Security

Microsemi FuseLock provides robust security against design theft. Special security fuses are hidden in the fabric of the device and protect against unauthorized users attempting to access the programming and/or probe interfaces. It is virtually impossible to identify or bypass these fuses without damaging the device, making Microsemi antifuse FPGAs protected with the highest level of security available from both invasive and noninvasive attacks.

Special security fuses in 40MX devices include the Probe Fuse and Program Fuse. The former disables the probing circuitry while the latter prohibits further programming of all fuses, including the Probe Fuse. In 42MX devices, there is the Security Fuse which, when programmed, both disables the probing circuitry and prohibits further programming of the device.

3.3.3 Programming

Device programming is supported through the Silicon Sculptor series of programmers. Silicon Sculptor is a compact, robust, single-site and multi-site device programmer for the PC. With standalone software, Silicon Sculptor is designed to allow concurrent programming of multiple units from the same PC.

3.8.1 3.3 V LVTTL Electrical Specifications

Table 19 • 3.3V LVTTL Electrical Specifications

Symbol	Parameter	Commercial		Commercial -F		Industrial		Military		Units
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.

d _{THL}	Capacitive Loading, HIGH to LOW		0.07		0.08		0.09		0.10		0.14 ns/pF

1. For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading.
