### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	72
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-fpl84">https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-fpl84</a>

## 2.4 Plastic Device Resources

**Table 2 • Plastic Device Resources**

Device	User I/Os											
	PLCC		PLCC		PQFP		PQFP		VQFP		TQFP	PBGA
	44-Pin	68-Pin	84-Pin	100-Pin	144-Pin	160-Pin	208-Pin	240-Pin	80-Pin	100-Pin	176-Pin	272-Pin
A40MX02	34	57	—	57	—	—	—	—	57	—	—	—
A40MX04	34	57	69	69	—	—	—	—	69	—	—	—
A42MX09	—	—	72	83	95	101	—	—	—	83	104	—
A42MX16	—	—	72	83	—	125	140	—	—	83	140	—
A42MX24	—	—	72	—	—	125	176	—	—	—	150	—
A42MX36	—	—	—	—	—	—	176	202	—	—	—	202

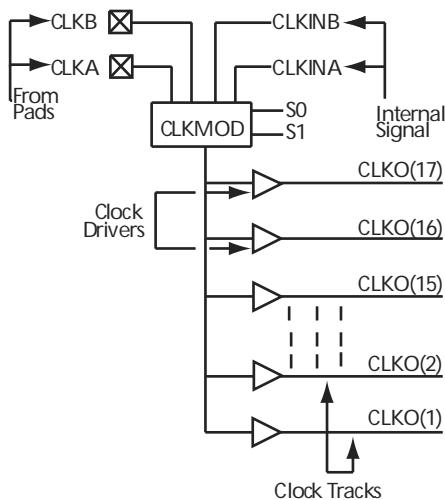

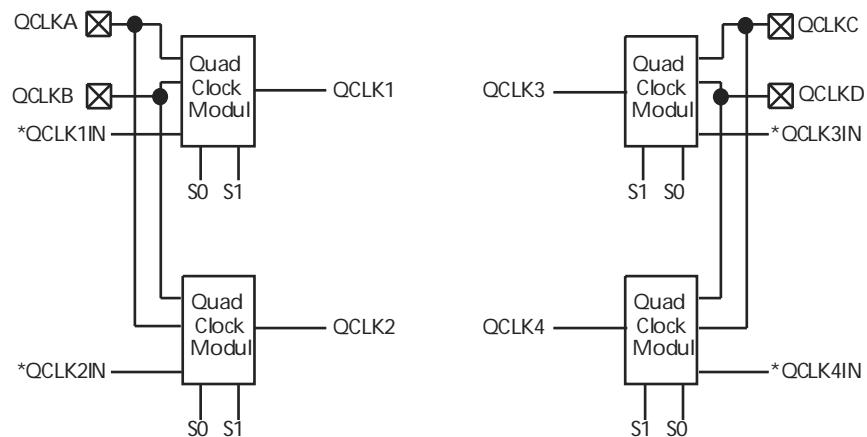

**Note:** **Package Definitions:** PLCC = Plastic Leaded Chip Carrier, PQFP = Plastic Quad Flat Pack, TQFP = Thin Quad Flat Pack, VQFP = Very Thin Quad Flat Pack, PBGA = Plastic Ball Grid Array

## 2.5 Ceramic Device Resources

**Table 3 • Ceramic Device Resources**

Device	User I/Os			
	CPGA 132-Pin	CQFP 172-Pin	CQFP 208-Pin	CQFP 256-Pin
A42MX09	95			
A42MX16		131		
A42MX36			176	202

**Note:** **Package Definitions:** CQFP = Ceramic Quad Flat Pack

**Figure 8 • Clock Networks of 42MX Devices****Figure 9 • Quadrant Clock Network of A42MX36 Devices**

**Note:** \*QCLK1IN, QCLK2IN, QCLK3IN, and QCLK4IN are internally-generated signals.

### 3.2.5 MultiPlex I/O Modules

42MX devices feature Multiplex I/Os and support 5.0 V, 3.3 V, and mixed 3.3 V/5.0 V operations.

The MultiPlex I/O modules provide the interface between the device pins and the logic array. Figure 10, page 12 is a block diagram of the 42MX I/O module. A variety of user functions, determined by a library macro selection, can be implemented in the module. (See the *Antifuse Macro Library Guide* for more information.) All 42MX I/O modules contain tristate buffers, with input and output latches that can be configured for input, output, or bidirectional operation.

All 42MX devices contain flexible I/O structures, where each output pin has a dedicated output-enable control (Figure 10, page 12). The I/O module can be used to latch input or output data, or both, providing fast set-up time. In addition, the Designer software tools can build a D-type flip-flop using a C-module combined with an I/O module to register input and output signals. See the *Antifuse Macro Library Guide* for more details.

A42MX24 and A42MX36 devices also offer selectable PCI output drives, enabling 100% compliance with version 2.1 of the PCI specification. For low-power systems, all inputs and outputs are turned off to reduce current consumption to below 500  $\mu$ A.

To achieve 5.0 V or 3.3 V PCI-compliant output drives on A42MX24 and A42MX36 devices, a chip-wide PCI fuse is programmed via the Device Selection Wizard in the Designer software (Figure 11, page 12). When the PCI fuse is not programmed, the output drive is standard.

- VCCA = Power supply in volts (V)
- F = Switching frequency in megahertz (MHz)

### 3.4.4 Equivalent Capacitance

Equivalent capacitance is calculated by measuring ICCactive at a specified frequency and voltage for each circuit component of interest. Measurements have been made over a range of frequencies at a fixed value of VCC. Equivalent capacitance is frequency-independent, so the results can be used over a wide range of operating conditions. Equivalent capacitance values are shown below.

### 3.4.5 C<sub>EQ</sub> Values for Microsemi MX FPGAs

Modules (C<sub>EQM</sub>)3.5

Input Buffers (C<sub>EQI</sub>)6.9

Output Buffers (C<sub>EQO</sub>)18.2

Routed Array Clock Buffer Loads (C<sub>EQCR</sub>)1.4

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. The equation below shows a piece-wise linear summation over all components.

$$\text{Power} = \text{VCCA}^2 * [(m * C_{EQM} * f_m)_{\text{modules}} + (n * C_{EQI} * f_n)_{\text{inputs}} + (p * (C_{EQO} + C_L) * f_p)_{\text{outputs}} + \\ 0.5 * (q_1 * C_{EQCR} * f_{q1})_{\text{routed\_Clk1}} + (r_1 * f_{q1})_{\text{routed\_Clk1}} + \\ 0.5 * (q_2 * C_{EQCR} * f_{q2})_{\text{routed\_Clk2}} + (r_2 * f_{q2})_{\text{routed\_Clk2}}(2)]$$

**EQ 3**

where:

m = Number of logic modules switching at frequency f<sub>m</sub>

n = Number of input buffers switching at frequency f<sub>n</sub>

p = Number of output buffers switching at frequency f<sub>p</sub>

q<sub>1</sub> = Number of clock loads on the first routed array clock

q<sub>2</sub> = Number of clock loads on the second routed array clock

r<sub>1</sub> = Fixed capacitance due to first routed array clock

r<sub>2</sub> = Fixed capacitance due to second routed array clock

C<sub>EQM</sub> = Equivalent capacitance of logic modules in pF

C<sub>EQI</sub> = Equivalent capacitance of input buffers in pF

C<sub>EQO</sub> = Equivalent capacitance of output buffers in pF

C<sub>EQCR</sub> = Equivalent capacitance of routed array clock in pF

C<sub>L</sub> = Output load capacitance in pF

f<sub>m</sub> = Average logic module switching rate in MHz

f<sub>n</sub> = Average input buffer switching rate in MHz

f<sub>p</sub> = Average output buffer switching rate in MHz

f<sub>q1</sub> = Average first routed array clock rate in MHz

$f_{q2}$  = Average second routed array clock rate in MHz)

**Table 7 • Fixed Capacitance Values for MX FPGAs (pF)**

Device Type	r1 routed_Clk1	r2 routed_Clk2
A40MX02	41.4	N/A
A40MX04	68.6	N/A
A42MX09	118	118
A42MX16	165	165
A42MX24	185	185
A42MX36	220	220

### 3.4.6 Test Circuitry and Silicon Explorer II Probe

MX devices contain probing circuitry that provides built-in access to every node in a design, via the use of Silicon Explorer II. Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer software, allow users to examine any of the internal nets of the device while it is operating in a prototyping or a production system. The user can probe into an MX device without changing the placement and routing of the design and without using any additional resources. Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle and providing a true representation of the device under actual functional situations.

Silicon Explorer II samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

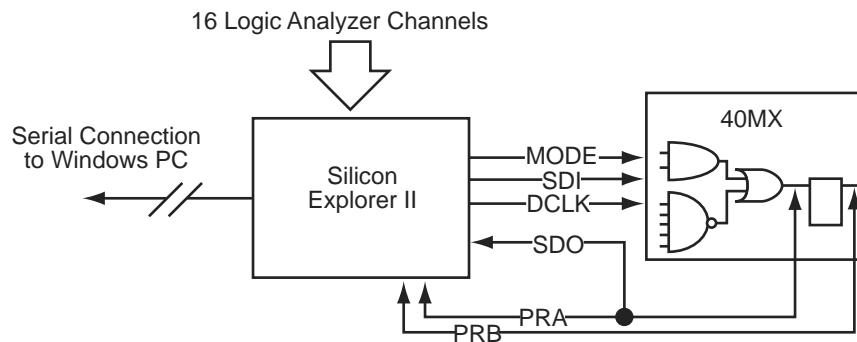

Silicon Explorer II is used to control the MODE, DCLK, SDI and SDO pins in MX devices to select the desired nets for debugging. The user simply assigns the selected internal nets in the Silicon Explorer II software to the PRA/PRB output pins for observation. Probing functionality is activated when the MODE pin is held HIGH.

Figure 12, page 16 illustrates the interconnection between Silicon Explorer II and 40MX devices, while Figure 13, page 17 illustrates the interconnection between Silicon Explorer II and 42MX devices.

To allow for probing capabilities, the security fuses must not be programmed. (See User Security, page 12 for the security fuses of 40MX and 42MX devices). Table 8, page 17 summarizes the possible device configurations for probing.

PRA and PRB pins are dual-purpose pins. When the "Reserve Probe Pin" is checked in the Designer software, PRA and PRB pins are reserved as dedicated outputs for probing. If PRA and PRB pins are required as user I/Os to achieve successful layout and "Reserve Probe Pin" is checked, the layout tool will override the option and place user I/Os on PRA and PRB pins.

**Figure 12 • Silicon Explorer II Setup with 40MX**

### 3.4.9 JTAG Mode Activation

The JTAG test logic circuit is activated in the Designer software by selecting **Tools > Device Selection**. This brings up the Device Selection dialog box as shown in the following figure. The JTAG test logic circuit can be enabled by clicking the “Reserve JTAG Pins” check box. The following table explains the pins’ behavior in either mode.

**Figure 15 • Device Selection Wizard**

**Table 11 • Boundary Scan Pin Configuration and Functionality**

Reserve JTAG	Checked	Unchecked
TCK	BST input; must be terminated to logical HIGH or LOW to avoid floating	User I/O
TDI, TMS	BST input; may float or be tied to HIGH	User I/O
TDO	BST output; may float or be connected to TDI of another device	User I/O

### 3.4.10 TRST Pin and TAP Controller Reset

An active reset (TRST) pin is not supported; however, MX devices contain power-on circuitry that resets the boundary scan circuitry upon power-up. Also, the TMS pin is equipped with an internal pull-up resistor. This allows the TAP controller to remain in or return to the Test-Logic-Reset state when there is no input or when a logical 1 is on the TMS pin. To reset the controller, TMS must be HIGH for at least five TCK cycles.

### 3.4.11 Boundary Scan Description Language (BSDL) File

Conforming to the IEEE Standard 1149.1 requires that the operation of the various JTAG components be documented. The BSDL file provides the standard format to describe the JTAG components that can be used by automatic test equipment software. The file includes the instructions that are supported, instruction bit pattern, and the boundary-scan chain order. For an in-depth discussion on BSDL files, see the *BSDL Files Format Description* application note.

BSDL files are grouped into two categories - generic and device-specific. The generic files assign all user I/Os as inouts. Device-specific files assign user I/Os as inputs, outputs or inouts.

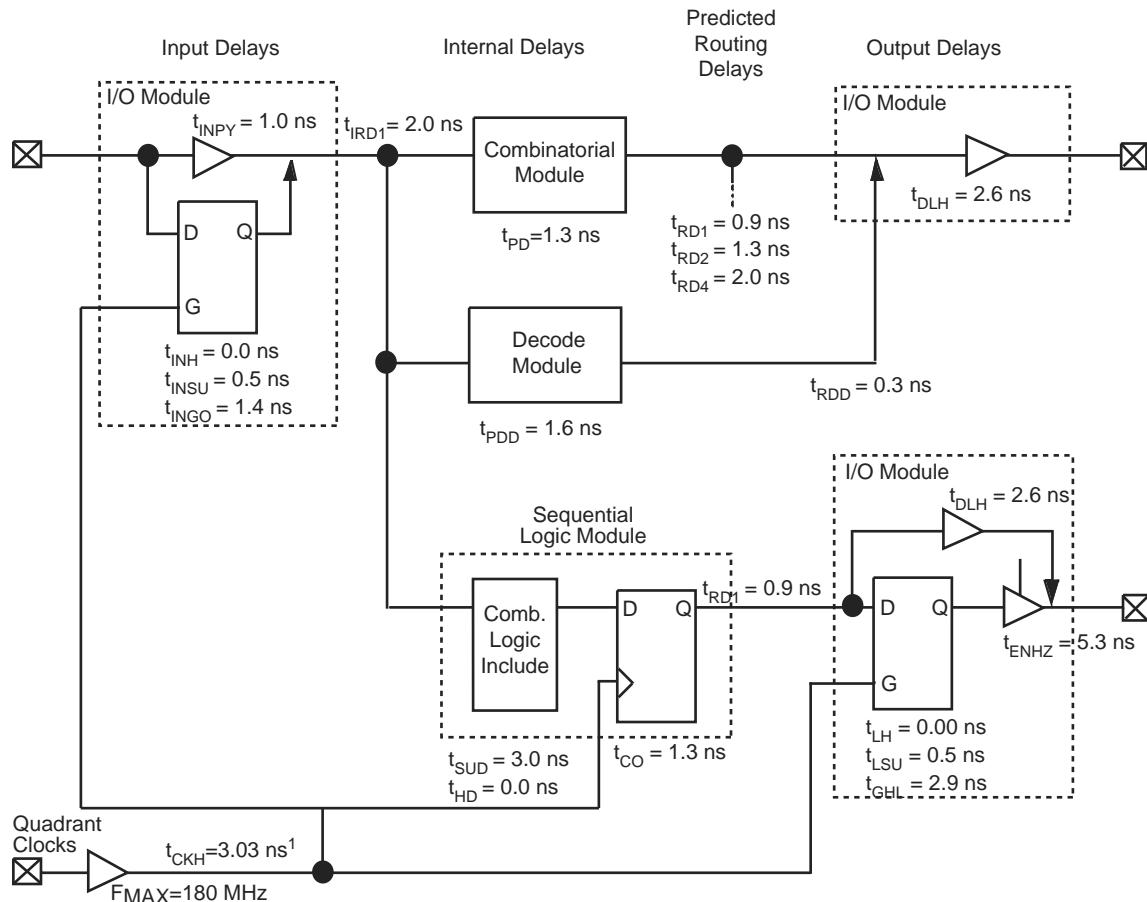

Generic files for MX devices are available on the Microsemi SoC Product Group's website:

<http://www.microsemi.com/soc/techdocs/models/bsdl.html>.

## 3.5 Development Tool Support

The MX family of FPGAs is fully supported by Libero® Integrated Design Environment (IDE). Libero IDE is a design management environment, seamlessly integrating design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design in a single environment. Libero IDE includes SynplifyPro from Synopsys, ModelSim® HDL Simulator from Mentor Graphics® and Viewdraw.

Libero IDE includes place-and-route and provides a comprehensive suite of backend support tools for FPGA development, including timing-driven place-and-route, and a world-class integrated static timing analyzer and constraints editor.

**Figure 19 • 42MX Timing Model (Logic Functions Using Quadrant Clocks)**

**Note:** 1. Load-dependent

**Note:** 2. Values are shown for A42MX36 –3 at 5.0 V worst-case commercial conditions

- For dual-module macros, use  $t_{PD1} + t_{RD1} + t_{PDn}$ ,  $t_{CO} + t_{RD1} + t_{PDn}$ , or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
- Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
- Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
- Delays based on 35 pF loading

**Table 39 • A42MX09 Timing Characteristics (Nominal 3.3 V Operation) (Worst-Case Commercial Conditions, VCCA = 3.0 V, TJ = 70°C)**

Parameter / Description	-3 Speed		-2 Speed		-1 Speed		Std Speed		-F Speed		Units
	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.

t <sub>RD2</sub>	FO = 2 Routing Delay	1.3		1.4		1.6		1.9		2.7	ns
t <sub>RD3</sub>	FO = 3 Routing Delay	1.6		1.8		2.0		2.4		3.3	ns

Clock signal to shift the Boundary Scan Test (BST) data into the device. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

#### **TDI, I/OTest Data In**

Serial data input for BST instructions and data. Data is shifted in on the rising edge of TCK. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

#### **TDO, I/OTest Data Out**

Serial data output for BST instructions and test data. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

#### **TMS, I/OTest Mode Select**

The TMS pin controls the use of the IEEE 1149.1 Boundary Scan pins (TCK, TDI, TDO). In flexible mode when the TMS pin is set LOW, the TCK, TDI and TDO pins are boundary scan pins. Once the boundary scan pins are in test mode, they will remain in that mode until the internal boundary scan state machine reaches the "logic reset" state. At this point, the boundary scan pins will be released and will function as regular I/O pins. The "logic reset" state is reached 5 TCK cycles after the TMS pin is set HIGH. In dedicated test mode, TMS functions as specified in the IEEE 1149.1 specifications. IEEE JTAG specification recommends a 10kΩ pull-up resistor on the pin. BST pins are only available in A42MX24 and A42MX36 devices.

#### **VCC, Supply Voltage**

Input supply voltage for 40MX devices

#### **VCCA, Supply Voltage**

Supply voltage for array in 42MX devices

#### **VCCI, Supply Voltage**

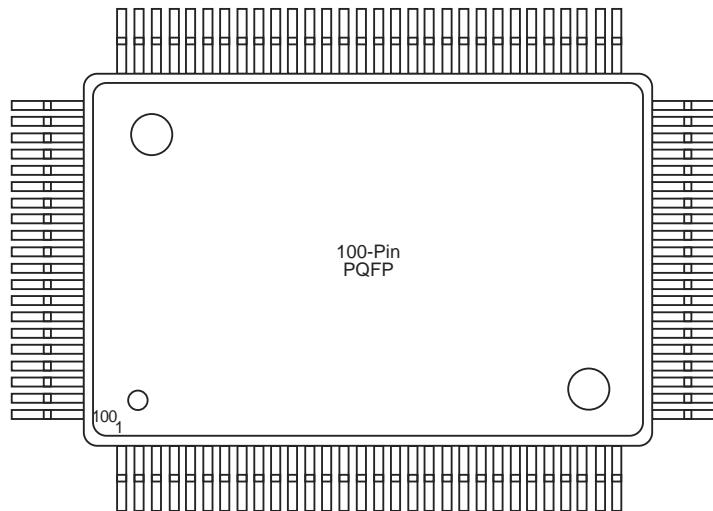

Supply voltage for I/Os in 42MX devices

#### **WD, IOWide Decode Output**

When a wide decode module is used in a 42MX device this pin can be used as a dedicated output from the wide decode module. This direct connection eliminates additional interconnect delays associated with regular logic modules. To implement the direct I/O connection, connect an output buffer of any type to the output of the wide decode macro and place this output on one of the reserved WD pins.
