Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	104
Number of Gates	14000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 125°C (TA)
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx09-tqg176a

- The Transient Current, page 13 is new (SAR 36930).
- Package names were revised according to standards established in *Package Mechanical Drawings* (SAR 34774)

1.7 Revision 9.0

The following is a summary of the changes in revision 9.0 of this document

- In Table 20, page 23, the limits in VI were changed from -0.5 to $V_{CCI} + 0.5$ to -0.5 to $V_{CCA} + 0.5$
- In Table 22, page 25, V_{OH} was changed from 3.7 to 2.4 for the min in industrial and military. V_{IH} had V_{CCI} and that was changed to V_{CCA}

1.8 Revision 6.0

The following is a summary of the changes in revision 6.0 of this document.

- The Ease of Integration, page 1 was updated
- The Temperature Grade Offerings, page 5 is new
- The Speed Grade Offerings, page 5 is new
- The General Description, page 6 was updated
- The MultiPlex I/O Modules, page 11 was updated
- The User Security, page 12 was updated
- Table 6, page 13 was updated
- The Power Dissipation, page 14 was updated.
- The Static Power Component, page 14 was updated
- The Equivalent Capacitance, page 15 was updated
- Figure 13, page 17 was updated
- Table 10, page 18 was updated.
- Figure 14, page 18 was updated.
- Table 11, page 19 was updated.

2.3 Ordering Information

The following figure shows ordering information. All the following tables show plastic and ceramic device resources, temperature and speed grade offerings.

Figure 1 • Ordering Information

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • 42MX IEEE 1149.1 Boundary Scan Circuitry

Table 9 • Test Access Port Descriptions

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • Supported BST Public Instructions

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

Figure 27 • Output Buffer Latches

3.10.4 Decode Module Timing

The following figure shows decode module timing.

Figure 28 • Decode Module Timing

3.10.5 SRAM Timing Characteristics

The following figure shows SRAM timing characteristics.

Figure 29 • SRAM Timing Characteristics

3.10.6 Dual-Port SRAM Timing Waveforms

The following figures show dual-port SRAM timing waveforms.

Table 31 • 40MX Temperature and Voltage Derating Factors (Normalized to T_J = 25°C, V_{CC} = 3.3 V)

40MX Voltage	Temperature						
	-55°C	-40°C	0°C	25°C	70°C	85°C	125°C
3.60	0.83	0.85	0.92	0.96	1.14	1.25	1.53

Figure 37 • 40MX Junction Temperature and Voltage Derating Curves (Normalized to T_J = 25°C, V_{CC} = 3.3 V)

Note: This derating factor applies to all routing and propagation delays

3.11.5 PCI System Timing Specification

The following tables list the critical PCI timing parameters and the corresponding timing parameters for the MX PCI-compliant devices.

3.11.6 PCI Models

Microsemi provides synthesizable VHDL and Verilog-HDL models for a PCI Target interface, a PCI Target and Target+DMA Master interface. Contact the Microsemi sales representative for more details.

Table 32 • Clock Specification for 33 MHz PCI

Symbol	Parameter	PCI		A42MX24		A42MX36		Units
		Min.	Max.	Min.	Max.	Min.	Max.
