### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	83
Number of Gates	24000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	100-BQFP
Supplier Device Package	100-PQFP (20x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a42mx16-1pq100m">https://www.e-xfl.com/product-detail/microchip-technology/a42mx16-1pq100m</a>

#### About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

## 2.4 Plastic Device Resources

**Table 2 • Plastic Device Resources**

Device	User I/Os											
	PLCC 44-Pin	PLCC 68-Pin	PLCC 84-Pin	PQFP 100-Pin	PQFP 144-Pin	PQFP 160-Pin	PQFP 208-Pin	PQFP 240-Pin	VQFP 80-Pin	VQFP 100-Pin	TQFP 176-Pin	PBGA 272-Pin

A42MX09	—	—	72	83	95	101	—	—	—	83	104	—
A42MX16	—	—	72	83	—	125	140	—	—	83	140	—
A42MX24	—	—	72	—	—	125	176	—	—	—	150	—
A42MX36	—	—	—	—	—	—	176	202	—	—	—	202

**Note:** **Package Definitions:** PLCC = Plastic Leaded Chip Carrier, PQFP = Plastic Quad Flat Pack, TQFP = Thin Quad Flat Pack, VQFP = Very Thin Quad Flat Pack, PBGA = Plastic Ball Grid Array

## 2.5 Ceramic Device Resources

**Table 3 • Ceramic Device Resources**

Device	User I/Os			
	CPGA 132-Pin	CQFP 172-Pin	CQFP 208-Pin	CQFP 256-Pin
A42MX09	95			
A42MX16		131		
A42MX36			176	202

**Note:** **Package Definitions:** CQFP = Ceramic Quad Flat Pack

**Figure 4 • 42MX S-Module Implementation**

A42MX24 and A42MX36 devices contain D-modules, which are arranged around the periphery of the device. D-modules contain wide-decode circuitry, providing a fast, wide-input AND function similar to that found in CPLD architectures (Figure 5, page 9). The D-module allows A42MX24 and A42MX36 devices to perform wide-decode functions at speeds comparable to CPLDs and PALs. The output of the D-module has a programmable inverter for active HIGH or LOW assertion. The D-module output is hardwired to an output pin, and can also be fed back into the array to be incorporated into other logic.

### 3.2.2 Dual-Port SRAM Modules

The A42MX36 device contains dual-port SRAM modules that have been optimized for synchronous or asynchronous applications. The SRAM modules are arranged in 256-bit blocks that can be configured as 32x8 or 64x4. SRAM modules can be cascaded together to form memory spaces of user-definable width and depth. A block diagram of the A42MX36 dual-port SRAM block is shown in Figure 6, page 9.

The A42MX36 SRAM modules are true dual-port structures containing independent read and write ports. Each SRAM module contains six bits of read and write addressing (RDAD[5:0] and WRAD[5:0], respectively) for 64x4-bit blocks. When configured in byte mode, the highest order address bits (RDAD5 and WRAD5) are not used. The read and write ports of the SRAM block contain independent clocks (RCLK and WCLK) with programmable polarities offering active HIGH or LOW implementation. The SRAM block contains eight data inputs (WD[7:0]), and eight outputs (RD[7:0]), which are connected to segmented vertical routing tracks.

The A42MX36 dual-port SRAM blocks provide an optimal solution for high-speed buffered applications requiring FIFO and LIFO queues. The ACTgen Macro Builder within Microsemi's designer software provides capability to quickly design memory functions with the SRAM blocks. Unused SRAM blocks can be used to implement registers for other user logic within the design.

**Figure 5 • A42MX24 and A42MX36 D-Module Implementation****Figure 6 • A42MX36 Dual-Port SRAM Block**

### 3.2.3 Routing Structure

The MX architecture uses vertical and horizontal routing tracks to interconnect the various logic and I/O modules. These routing tracks are metal interconnects that may be continuous or split into segments. Varying segment lengths allow the interconnect of over 90% of design tracks to occur with only two antifuse connections. Segments can be joined together at the ends using antifuses to increase their lengths up to the full length of the track. All interconnects can be accomplished with a maximum of four antifuses.

#### 3.2.3.1 Horizontal Routing

Horizontal routing tracks span the whole row length or are divided into multiple segments and are located in between the rows of modules. Any segment that spans more than one-third of the row length is considered a long horizontal segment. A typical channel is shown in [Figure 7](#), page 10. Within horizontal routing, dedicated routing tracks are used for global clock networks and for power and ground tie-off tracks. Non-dedicated tracks are used for signal nets.

#### 3.2.3.2 Vertical Routing

Another set of routing tracks run vertically through the module. There are three types of vertical tracks: input, output, and long. Long tracks span the column length of the module, and can be divided into multiple segments. Each segment in an input track is dedicated to the input of a particular module; each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing.

Each output segment spans four channels (two above and two below), except near the top and bottom of the array, where edge effects occur. Long vertical tracks contain either one or two segments. An example of vertical routing tracks and segments is shown in [Figure 7](#), page 10.

reliability. Devices should not be operated outside the recommended operating conditions.

**Table 21 • Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature Range*	0 to +70	-40 to +85	-55 to +125	°C
VCCA	4.75 to 5.25	4.5 to 5.5	4.5 to 5.5	V
VCCI	3.14 to 3.47	3.0 to 3.6	3.0 to 3.6	V

**Note:** \*Ambient temperature ( $T_A$ ) is used for commercial and industrial grades; case temperature ( $T_C$ ) is used for military grades.

### 3.9.3 Output Drive Characteristics for 3.3 V PCI Signaling

Table 25 • DC Specification (3.3 V PCI Signaling)<sup>1</sup>

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
VCCI	Supply Voltage for I/Os		3.0	3.6	3.0	3.6 <sup>2</sup>	V
VIH	Input High Voltage		0.5	VCC + 0.5	0.5	VCCI + 0.3	V
VIL	Input Low Voltage		-0.5	0.8	-0.3	0.8	V
I <sub>IH</sub>	Input High Leakage Current	VIN = 2.7 V		70		10	µA
I <sub>IL</sub>	Input Leakage Current			-70		-10	µA
VOH	Output High Voltage	I <sub>OUT</sub> = -2 mA	0.9		3.3		V
VOL	Output Low Voltage	I <sub>OUT</sub> = 3 mA, 6 mA		0.1		0.1 VCCI	V
C <sub>IN</sub>	Input Pin Capacitance			10		10	pF
C <sub>CLK</sub>	CLK Pin Capacitance		5	12		10	pF
L <sub>PIN</sub>	Pin Inductance			20		< 8 nH <sup>3</sup>	nH

1. PCI Local Bus Specification, Version 2.1, Section 4.2.2.1.

2. Maximum rating for VCCI -0.5 V to 7.0V.

3. Dependent upon the chosen package. PCI recommends QFP and BGA packaging to reduce pin inductance and capacitance.

Table 26 • AC Specifications for (3.3 V PCI Signaling)\*

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
ICL	Low Clamp Current	-5 < VIN ≤ -1	-25 + (VIN +1) /0.015		-60	-10	mA
Slew (r)	Output Rise Slew Rate	0.2 V to 0.6 V load	1		4	1.8	V/ns
Slew (f)	Output Fall Slew Rate	0.6 V to 0.2 V load	1		4	2.8	4.0
							V/ns

Note: \*PCI Local Bus Specification, Version 2.1, Section 4.2.2.2.

**Figure 19 • 42MX Timing Model (Logic Functions Using Quadrant Clocks)**

**Note:** 1. Load-dependent

**Note:** 2. Values are shown for A42MX36 –3 at 5.0 V worst-case commercial conditions

### 3.10.2 Sequential Module Timing Characteristics

The following figure shows sequential module timing characteristics.

**Figure 25 • Flip-Flops and Latches**

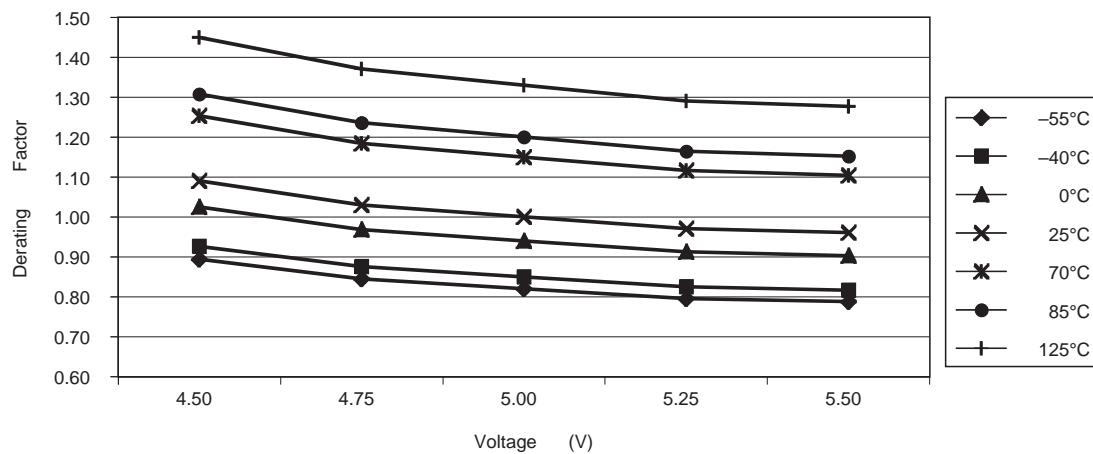

**Note:** \*D represents all data functions involving A, B, and S for multiplexed flip-flops.

### 3.10.3 Sequential Timing Characteristics

The following figures show sequential timing characteristics.

**Figure 26 • Input Buffer Latches**
