[Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	125
Number of Gates	24000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx16-1pqqg160

3.2.3.3 Antifuse Structures

An antifuse is a “normally open” structure. The use of antifuses to implement a programmable logic device results in highly testable structures as well as efficient programming algorithms. There are no pre-existing connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed and individual circuit structures to be tested, which can be done before and after programming. For instance, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Figure 7 • MX Routing Structure

3.2.4 Clock Networks

The 40MX devices have one global clock distribution network (CLK). A signal can be put on the CLK network by being routed through the CLKBUF buffer.

In 42MX devices, there are two low-skew, high-fanout clock distribution networks, referred to as CLKA and CLKB. Each network has a clock module (CLKMOD) that can select the source of the clock signal from any of the following (Figure 8, page 11):

- Externally from the CLKA pad, using CLKBUF buffer
- Externally from the CLKB pad, using CLKBUF buffer
- Internally from the CLKINTA input, using CLKINT buffer
- Internally from the CLKINTB input, using CLKINT buffer

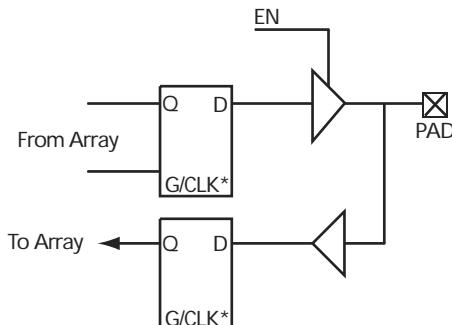

The clock modules are located in the top row of I/O modules. Clock drivers and a dedicated horizontal clock track are located in each horizontal routing channel.

Clock input pads in both 40MX and 42MX devices can also be used as normal I/Os, bypassing the clock networks.

The A42MX36 device has four additional register control resources, called quadrant clock networks (Figure 9, page 11). Each quadrant clock provides a local, high-fanout resource to the contiguous logic modules within its quadrant of the device. Quadrant clock signals can originate from specific I/O pins or from the internal array and can be used as a secondary register clock, register clear, or output enable.

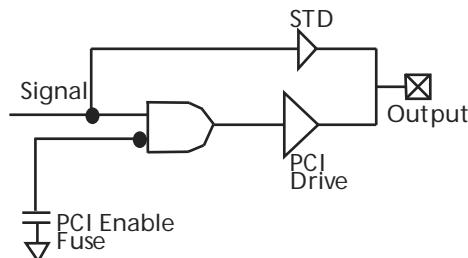

Designer software development tools provide a design library of I/O macro functions that can implement all I/O configurations supported by the MX FPGAs.

Figure 10 • 42MX I/O Module

Note: *Can be configured as a Latch or D Flip-Flop (Using C-Module)

Figure 11 • PCI Output Structure of A42MX24 and A42MX36 Devices

3.3 Other Architectural Features

The following sections cover other architectural features of 40MX and 42MX FPGAs.

3.3.1 Performance

MX devices can operate with internal clock frequencies of 250 MHz, enabling fast execution of complex logic functions. MX devices are live on power-up and do not require auxiliary configuration devices and thus are an optimal platform to integrate the functionality contained in multiple programmable logic devices. In addition, designs that previously would have required a gate array to meet performance can be integrated into an MX device with improvements in cost and time-to-market. Using timing-driven place-and-route (TDPR) tools, designers can achieve highly deterministic device performance.

3.3.2 User Security

Microsemi FuseLock provides robust security against design theft. Special security fuses are hidden in the fabric of the device and protect against unauthorized users attempting to access the programming and/or probe interfaces. It is virtually impossible to identify or bypass these fuses without damaging the device, making Microsemi antifuse FPGAs protected with the highest level of security available from both invasive and noninvasive attacks.

Special security fuses in 40MX devices include the Probe Fuse and Program Fuse. The former disables the probing circuitry while the latter prohibits further programming of all fuses, including the Probe Fuse. In 42MX devices, there is the Security Fuse which, when programmed, both disables the probing circuitry and prohibits further programming of the device.

3.3.3 Programming

Device programming is supported through the Silicon Sculptor series of programmers. Silicon Sculptor is a compact, robust, single-site and multi-site device programmer for the PC. With standalone software, Silicon Sculptor is designed to allow concurrent programming of multiple units from the same PC.

A sample calculation of the absolute maximum power dissipation allowed for a TQ176 package at commercial temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (\text{°C}) - \text{Max} \cdot \text{ambient temp} \cdot (\text{°C})}{\theta_{ja}(\text{°C/W})} = \frac{150\text{°C} - 70\text{°C}}{(28\text{°C})/\text{W}} = 2.86\text{W}$$

EQ 5

The maximum power dissipation for military-grade devices is a function of θ_{jc} . A sample calculation of the absolute maximum power dissipation allowed for CQFP 208-pin package at military temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (\text{°C}) - \text{Max} \cdot \text{ambient temp} \cdot (\text{°C})}{\theta_{jc}(\text{°C/W})} = \frac{150\text{°C} - 125\text{°C}}{(6.3\text{°C})/\text{W}} = 3.97\text{W}$$

EQ 6

		FO = 384	6.6	7.4	8.3	9.8	13.7	ns			

Table 44 • A42MX36 Timing Characteristics (Nominal 5.0 V Operation)(Worst-Case Commercial Conditions, VCCA = 4.75 V, TJ = 70°C)

Parameter / Description	-3 Speed		-2 Speed		-1 Speed		Std Speed		-F Speed		Units
	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
Asynchronous SRAM Operations											
t _{RPD}	Asynchronous Access Time		8.1		9.0		10.2		12.0		16.8 ns
t _{RDADV}	Read Address Valid		8.8		9.8		11.1		13.0		18.2 ns
t _{ADSU}	Address/Data Set-Up Time		1.6		1.8		2.0		2.4		3.4 ns
t _{ADH}	Address/Data Hold Time		0.0		0.0		0.0		0.0		0.0 ns
t _{RENSUA}	Read Enable Set-Up to Address Valid		0.6		0.7		0.8		0.9		1.3 ns
t _{RENHA}	Read Enable Hold		3.4		3.8		4.3		5.0		7.0 ns
t _{WENSU}	Write Enable Set-Up		2.7		3.0		3.4		4.0		5.6 ns
t _{WENH}	Write Enable Hold		0.0		0.0		0.0		0.0		0.0 ns
t _{DOH}	Data Out Hold Time		1.2		1.3		1.5		1.8		2.5 ns
Input Module Propagation Delays											
t _{INPY}	Input Data Pad-to-Y		1.0		1.1		1.3		1.5		2.1 ns
t _{INGO}	Input Latch Gate-to-Output		1.4		1.6		1.8		2.1		2.9 ns
t _{INH}	Input Latch Hold		0.0		0.0		0.0		0.0		0.0 ns
t _{INSU}	Input Latch Set-Up		0.5		0.5		0.6		0.7		1.0 ns
t _{ILA}	Latch Active Pulse Width		4.7		5.2		5.9		6.9		9.7 ns
Input Module Predicted Routing Delays²											
t _{IRD1}	FO = 1 Routing Delay		2.0		2.2		2.5		2.9		4.1 ns
t _{IRD2}	FO = 2 Routing Delay		2.3		2.6		2.9		3.4		4.8 ns
t _{IRD3}	FO = 3 Routing Delay		2.6		2.9		3.3		3.9		5.5 ns
t _{IRD4}	FO = 4 Routing Delay		3.0		3.3		3.8		4.4		6.2 ns
t _{IRD8}	FO = 8 Routing Delay		4.3		4.8		5.5		6.4		9.0 ns
Global Clock Network											
t _{CKH}	Input LOW to HIGH	FO = 32	2.7		3.0		3.4		4.0		5.6 ns
		FO = 635	3.0		3.3		3.8		4.4		6.2 ns
t _{CKL}	Input HIGH to LOW	FO = 32	3.8		4.2		4.8		5.6		7.8 ns
		FO = 635	4.9		5.4		6.1		7.2		10.1 ns
t _{PWH}	Minimum Pulse Width HIGH	FO = 32	1.8		2.0		2.2		2.6		3.6 ns
		FO = 635	2.0		2.2		2.5		2.9		4.1 ns
t _{PWL}	Minimum Pulse Width LOW	FO = 32	1.8		2.0		2.2		2.6		3.6 ns
		FO = 635	2.0		2.2		2.5		2.9		4.1 ns
t _{CKSW}	Maximum Skew	FO = 32	0.8		0.8		0.9		1.0		1.4 ns
		FO = 635	0.8		0.8		0.9		1.0		1.4 ns
