Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Figure 2 • 42MX C-Module Implementation

The 42MX devices contain three types of logic modules: combinatorial (C-modules), sequential (S-modules) and decode (D-modules). The following figure illustrates the combinatorial logic module. The S-module, shown in Figure 4, page 8, implements the same combinatorial logic function as the C-module while adding a sequential element. The sequential element can be configured as either a D-flip-flop or a transparent latch. The S-module register can be bypassed so that it implements purely combinatorial logic.

A sample calculation of the absolute maximum power dissipation allowed for a TQ176 package at commercial temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (^\circ\text{C}) - \text{Max} \cdot \text{ambient temp} \cdot (^\circ\text{C})}{\theta_{ja} (^\circ\text{C/W})} = \frac{150^\circ\text{C} - 70^\circ\text{C}}{(28^\circ\text{C})/\text{W}} = 2.86\text{W}$$

EQ 5

The maximum power dissipation for military-grade devices is a function of θ_{jc} . A sample calculation of the absolute maximum power dissipation allowed for CQFP 208-pin package at military temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (^\circ\text{C}) - \text{Max} \cdot \text{ambient temp} \cdot (^\circ\text{C})}{\theta_{jc} (^\circ\text{C/W})} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{(6.3^\circ\text{C})/\text{W}} = 3.97\text{W}$$
