

Welcome to [E-XFL.COM](#)

[Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	140
Number of Gates	24000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx16-3tqg176i

2 40MX and 42MX FPGA Families

2.1 Features

The following sections list out various features of the 40MX and 42MX FPGA family devices.

2.1.1 High Capacity

- Single-Chip ASIC Alternative
- 3,000 to 54,000 System Gates
- Up to 2.5 kbits Configurable Dual-Port SRAM
- Fast Wide-Decode Circuitry
- Up to 202 User-Programmable I/O Pins

2.1.2 High Performance

- 5.6 ns Clock-to-Out
- 250 MHz Performance
- 5 ns Dual-Port SRAM Access
- 100 MHz FIFOs
- 7.5 ns 35-Bit Address Decode

2.1.3 HiRel Features

- Commercial, Industrial, Automotive, and Military Temperature Plastic Packages
- Commercial, Military Temperature, and MIL-STD-883 Ceramic Packages
- QML Certification
- Ceramic Devices Available to DSCC SMD

2.1.4 Ease of Integration

- Mixed-Voltage Operation (5.0 V or 3.3 V for core and I/Os), with PCI-Compliant I/Os
- Up to 100% Resource Utilization and 100% Pin Locking
- Deterministic, User-Controllable Timing
- Unique In-System Diagnostic and Verification Capability with Silicon Explorer II
- Low Power Consumption
- IEEE Standard 1149.1 (JTAG) Boundary Scan Testing

2.2 Product Profile

The following table gives the features of the products.

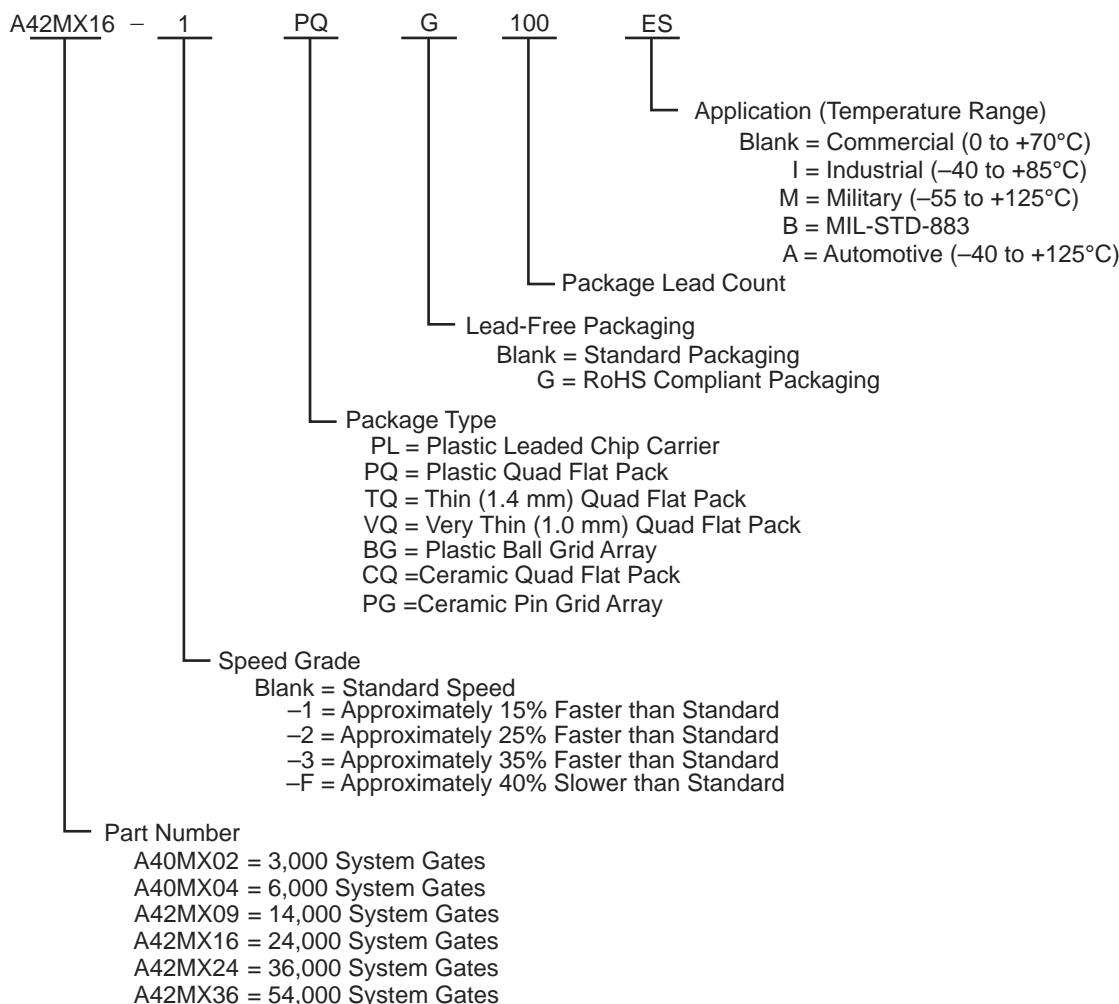

Table 1 • Product profile

Device	A40MX02	A40MX04	A42MX09	A42MX16	A42MX24	A42MX36
Capacity						
System Gates	3,000	6,000	14,000	24,000	36,000	54,000
SRAM Bits	—	—	—	—	—	2,560
Logic Modules						
Sequential	—	—	348	624	954	1,230
Combinatorial	295	547	336	608	912	1,184
Decode	—	—	—	—	24	24
Clock-to-Out						
	9.5 ns	9.5 ns	5.6 ns	6.1 ns	6.1 ns	6.3 ns
SRAM Modules (64x4 or 32x8)						
	—	—	—	—	—	10
Dedicated Flip-Flops						
	—	—	348	624	954	1,230

2.3 Ordering Information

The following figure shows ordering information. All the following tables show plastic and ceramic device resources, temperature and speed grade offerings.

Figure 1 • Ordering Information

Silicon Sculptor programs devices independently to achieve the fastest programming times possible. After being programmed, each fuse is verified to insure that it has been programmed correctly. Furthermore, at the end of programming, there are integrity tests that are run to ensure no extra fuses have been programmed. Not only does it test fuses (both programmed and non-programmed), Silicon Sculptor also allows self-test to verify its own hardware extensively.

The procedure for programming an MX device using Silicon Sculptor is as follows:

1. Load the *.AFM file
2. Select the device to be programmed
3. Begin programming

When the design is ready to go to production, Microsemi offers device volume-programming services either through distribution partners or via In-House Programming from the factory.

For more details on programming MX devices, see the *AC225: Programming Antifuse Devices* application note and the *Silicon Sculptor 3 Programmers User Guide*.

3.3.4 Power Supply

MX devices are designed to operate in both 5.0V and 3.3V environments. In particular, 42MX devices can operate in mixed 5.0 V/3.3 V systems. The following table describes the voltage support of MX devices.

Table 6 • Voltage Support of MX Devices

Device	VCC	VCCA	VCCI	Maximum Input Tolerance	Nominal Output Voltage
40MX	5.0 V	—	—	5.5 V	5.0 V
	3.3 V	—	—	3.6 V	3.3 V
42MX	—	5.0 V	5.0 V	5.5 V	5.0 V
	—	3.3 V	3.3 V	3.6 V	3.3 V
	—	5.0 V	3.3 V	5.5 V	3.3 V

For A42MX24 and A42MX36 devices the VCCA supply has to be monotonic during power up in order for the POR to issue reset to the JTAG state machine correctly. For more information, see the *AC291: 42MX Family Devices Power-Up Behavior*.

3.3.5 Power-Up/Down in Mixed-Voltage Mode

When powering up 42MX in mixed voltage mode (VCCA = 5.0 V and VCCI = 3.3 V), VCCA must be greater than or equal to VCCI throughout the power-up sequence. If VCCI exceeds VCCA during power-up, one of two things will happen:

- The input protection diode on the I/Os will be forward biased
- The I/Os will be at logical High

In either case, ICC rises to high levels. For power-down, any sequence with VCCA and VCCI can be implemented.

3.3.6 Transient Current

Due to the simultaneous random logic switching activity during power-up, a transient current may appear on the core supply (VCC). Customers must use a regulator for the VCC supply that can source a minimum of 100 mA for transient current during power-up. Failure to provide enough power can prevent the system from powering up properly and result in functional failure. However, there are no reliability concerns, since transient current is distributed across the die instead of confined to a localized spot.

Since the transient current is not due to I/O switching, its value and duration are independent of the VCCI.

- VCCA = Power supply in volts (V)
- F = Switching frequency in megahertz (MHz)

3.4.4 Equivalent Capacitance

Equivalent capacitance is calculated by measuring ICCactive at a specified frequency and voltage for each circuit component of interest. Measurements have been made over a range of frequencies at a fixed value of VCC. Equivalent capacitance is frequency-independent, so the results can be used over a wide range of operating conditions. Equivalent capacitance values are shown below.

3.4.5 C_{EQ} Values for Microsemi MX FPGAs

Modules (C_{EQM})3.5

Input Buffers (C_{EQI})6.9

Output Buffers (C_{EQO})18.2

Routed Array Clock Buffer Loads (C_{EQCR})1.4

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. The equation below shows a piece-wise linear summation over all components.

$$\text{Power} = \text{VCCA}^2 * [(m * C_{EQM} * f_m)_{\text{modules}} + (n * C_{EQI} * f_n)_{\text{inputs}} + (p * (C_{EQO} + C_L) * f_p)_{\text{outputs}} + \\ 0.5 * (q_1 * C_{EQCR} * f_{q1})_{\text{routed_Clk1}} + (r_1 * f_{q1})_{\text{routed_Clk1}} + \\ 0.5 * (q_2 * C_{EQCR} * f_{q2})_{\text{routed_Clk2}} + (r_2 * f_{q2})_{\text{routed_Clk2}}(2)]$$

EQ 3

where:

m = Number of logic modules switching at frequency f_m

n = Number of input buffers switching at frequency f_n

p = Number of output buffers switching at frequency f_p

q₁ = Number of clock loads on the first routed array clock

q₂ = Number of clock loads on the second routed array clock

r₁ = Fixed capacitance due to first routed array clock

r₂ = Fixed capacitance due to second routed array clock

C_{EQM} = Equivalent capacitance of logic modules in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of routed array clock in pF

C_L = Output load capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average first routed array clock rate in MHz

3.9.3 Output Drive Characteristics for 3.3 V PCI Signaling

Table 25 • DC Specification (3.3 V PCI Signaling)¹

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
VCCI	Supply Voltage for I/Os		3.0	3.6	3.0	3.6 ²	V
VIH	Input High Voltage		0.5	VCC + 0.5	0.5	VCCI + 0.3	V
VIL	Input Low Voltage		-0.5	0.8	-0.3	0.8	V
I _{IH}	Input High Leakage Current	VIN = 2.7 V		70		10	µA
I _{IL}	Input Leakage Current			-70		-10	µA
V _{OH}	Output High Voltage	I _{OUT} = -2 mA	0.9		3.3		V
V _{OL}	Output Low Voltage	I _{OUT} = 3 mA, 6 mA	0.1		0.1 VCCI		V
C _{IN}	Input Pin Capacitance			10		10	pF
C _{CLK}	CLK Pin Capacitance		5	12		10	pF
L _{PIN}	Pin Inductance			20		< 8 nH ³	nH

1. PCI Local Bus Specification, Version 2.1, Section 4.2.2.1.

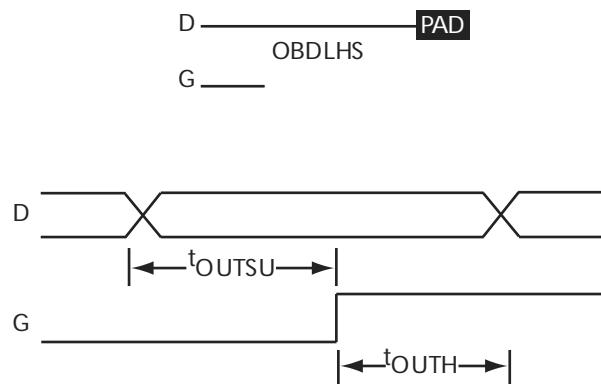

2. Maximum rating for VCCI -0.5 V to 7.0V.

3. Dependent upon the chosen package. PCI recommends QFP and BGA packaging to reduce pin inductance and capacitance.

Table 26 • AC Specifications for (3.3 V PCI Signaling)^{*}

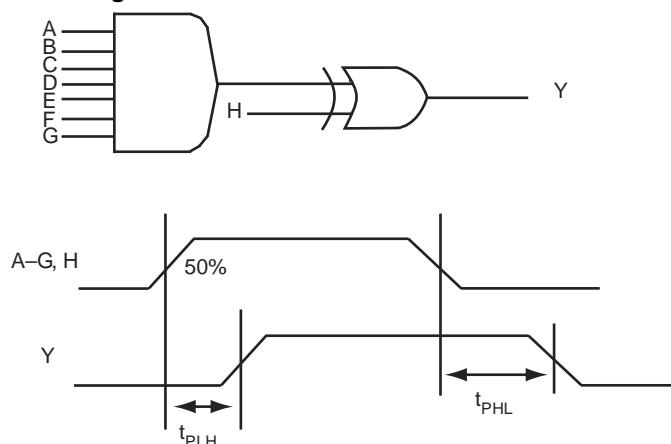

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
I _{CL}	Low Clamp Current	-5 < VIN ≤ -1	-25 + (VIN +1) /0.015		-60	-10	mA
Slew (r)	Output Rise Slew Rate	0.2 V to 0.6 V load	1		4	1.8	V/ns
Slew (f)	Output Fall Slew Rate	0.6 V to 0.2 V load	1		4	2.8	4.0
							V/ns

Note: *PCI Local Bus Specification, Version 2.1, Section 4.2.2.2.

Figure 27 • Output Buffer Latches

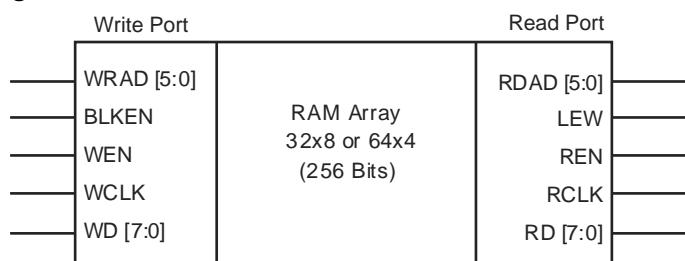

3.10.4 Decode Module Timing

The following figure shows decode module timing.

Figure 28 • Decode Module Timing

3.10.5 SRAM Timing Characteristics

The following figure shows SRAM timing characteristics.

Figure 29 • SRAM Timing Characteristics

3.10.6 Dual-Port SRAM Timing Waveforms

The following figures show dual-port SRAM timing waveforms.
