Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

1.1 Revision 15.0

The following is a summary of the changes in revision 15.0 of this document.

- Table 15, page 21 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
- Table 22, page 25 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V
- Table 23, page 25 is edited to add the footnote, VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V

1.2 Revision 14.0

The following is a summary of the changes in revision 14.0 of this document.

- Added CQFP package information for A42MX16 device in Product Profile, page 1 and Ceramic Device Resources, page 4 (SAR 79522).
- Added Military (M) and MIL-STD-883 Class B (B) grades for CPGA 132 Package and added Commercial (C), Military (M), and MIL-STD-883 Class B (B) grades for CQFP 172 Package in Temperature Grade Offerings, page 5 (SAR 79519)
- Changed Silicon Sculptor II to Silicon Sculptor in Programming, page 12 (SAR 38754)
- Added Figure 53, page 158 CQ172 package (SAR 79522).

1.3 Revision 13.0

The following is a summary of the changes in revision 13.0 of this document.

- Added Figure 42, page 97 PQ144 Package for A42MX09 device (SAR 69776)
- Added Figure 52, page 153 PQ132 Package for A42MX09 device (SAR 69776)

1.4 Revision 12.0

The following is a summary of the changes in revision 12.0 of this document.

- Added information on power-up behavior for A42MX24 and A42MX36 devices to the Power Supply, page 13 (SAR 42096)
- Corrected the inadvertent mistake in the naming of the PL68 pin assignment table (SARs 48999, 49793)

1.5 Revision 11.0

The following is a summary of the changes in revision 11.0 of this document.

- The FuseLock logo and accompanying text was removed from the User Security, page 12. This marking is no longer used on Microsemi devices (PCN 0915)
- The Development Tool Support, page 19 was updated (SAR 38512)

1.6 Revision 10.0

The following is a summary of the changes in revision 10.0 of this document.

- Ordering Information, page 3 was updated to include lead-free package ordering codes (SAR 21968)
- The User Security, page 12 was revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34673)

3 40MX and 42MX FPGAs

3.1 General Description

Microsemi's 40MX and 42MX families offer a cost-effective design solution at 5V. The MX devices are single-chip solutions and provide high performance while shortening the system design and development cycle. MX devices can integrate and consolidate logic implemented in multiple PALs, CPLDs, and FPGAs. Example applications include high-speed controllers and address decoding, peripheral bus interfaces, DSP, and co-processor functions.

The MX device architecture is based on Microsemi's patented antifuse technology implemented in a 0.45 μ m triple-metal CMOS process. With capacities ranging from 3,000 to 54,000 system gates, the MX devices provide performance up to 250 MHz, are live on power-up and have one-fifth the standby power consumption of comparable FPGAs. MX FPGAs provide up to 202 user I/Os and are available in a wide variety of packages and speed grades.

A42MX24 and A42MX36 devices also feature multiPlex I/Os, which support mixed-voltage systems, enable programmable PCI, deliver high-performance operation at both 5.0V and 3.3V, and provide a low-power mode. The devices are fully compliant with the PCI local bus specification (version 2.1). They deliver 200 MHz on-chip operation and 6.1 ns clock-to-output performance.

The 42MX24 and 42MX36 devices include system-level features such as IEEE Standard 1149.1 (JTAG) Boundary Scan Testing and fast wide-decode modules. In addition, the A42MX36 device offers dual-port SRAM for implementing fast FIFOs, LIFOs, and temporary data storage. The storage elements can efficiently address applications requiring wide data path manipulation and can perform transformation functions such as those required for telecommunications, networking, and DSP.

All MX devices are fully tested over automotive and military temperature ranges. In addition, the largest member of the family, the A42MX36, is available in both CQ208 and CQ256 ceramic packages screened to MIL-STD-883 levels. For easy prototyping and conversion from plastic to ceramic, the CQ208 and PQ208 devices are pin-compatible.

3.2 MX Architectural Overview

The MX devices are composed of fine-grained building blocks that enable fast, efficient logic designs. All devices within these families are composed of logic modules, I/O modules, routing resources and clock networks, which are the building blocks for fast logic designs. In addition, the A42MX36 device contains embedded dual-port SRAM modules, which are optimized for high-speed data path functions such as FIFOs, LIFOs and scratch pad memory. A42MX24 and A42MX36 also contain wide-decode modules.

3.2.1 Logic Modules

The 40MX logic module is an eight-input, one-output logic circuit designed to implement a wide range of logic functions with efficient use of interconnect routing resources.(see the following figure).

The logic module can implement the four basic logic functions (NAND, AND, OR and NOR) in gates of two, three, or four inputs. The logic module can also implement a variety of D-latches, exclusivity functions, AND-ORs and OR-ANDs. No dedicated hard-wired latches or flip-flops are required in the array; latches and flip-flops can be constructed from logic modules whenever required in the application.

Note: *Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the recommended operating conditions.

- For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
- Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
- Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
- Delays based on 35 pF loading.
