Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	140
Number of Gates	24000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a42mx16-tq176

Silicon Sculptor programs devices independently to achieve the fastest programming times possible. After being programmed, each fuse is verified to insure that it has been programmed correctly. Furthermore, at the end of programming, there are integrity tests that are run to ensure no extra fuses have been programmed. Not only does it test fuses (both programmed and non-programmed), Silicon Sculptor also allows self-test to verify its own hardware extensively.

The procedure for programming an MX device using Silicon Sculptor is as follows:

1. Load the *.AFM file
2. Select the device to be programmed
3. Begin programming

When the design is ready to go to production, Microsemi offers device volume-programming services either through distribution partners or via In-House Programming from the factory.

For more details on programming MX devices, see the *AC225: Programming Antifuse Devices* application note and the *Silicon Sculptor 3 Programmers User Guide*.

3.3.4 Power Supply

MX devices are designed to operate in both 5.0V and 3.3V environments. In particular, 42MX devices can operate in mixed 5.0 V/3.3 V systems. The following table describes the voltage support of MX devices.

Table 6 • Voltage Support of MX Devices

Device	VCC	VCCA	VCCI	Maximum Input Tolerance	Nominal Output Voltage
40MX	5.0 V	—	—	5.5 V	5.0 V
	3.3 V	—	—	3.6 V	3.3 V
42MX	—	5.0 V	5.0 V	5.5 V	5.0 V
	—	3.3 V	3.3 V	3.6 V	3.3 V
	—	5.0 V	3.3 V	5.5 V	3.3 V

For A42MX24 and A42MX36 devices the VCCA supply has to be monotonic during power up in order for the POR to issue reset to the JTAG state machine correctly. For more information, see the *AC291: 42MX Family Devices Power-Up Behavior*.

3.3.5 Power-Up/Down in Mixed-Voltage Mode

When powering up 42MX in mixed voltage mode (VCCA = 5.0 V and VCCI = 3.3 V), VCCA must be greater than or equal to VCCI throughout the power-up sequence. If VCCI exceeds VCCA during power-up, one of two things will happen:

- The input protection diode on the I/Os will be forward biased
- The I/Os will be at logical High

In either case, ICC rises to high levels. For power-down, any sequence with VCCA and VCCI can be implemented.

3.3.6 Transient Current

Due to the simultaneous random logic switching activity during power-up, a transient current may appear on the core supply (VCC). Customers must use a regulator for the VCC supply that can source a minimum of 100 mA for transient current during power-up. Failure to provide enough power can prevent the system from powering up properly and result in functional failure. However, there are no reliability concerns, since transient current is distributed across the die instead of confined to a localized spot.

Since the transient current is not due to I/O switching, its value and duration are independent of the VCCI.

Each I/O cell has three boundary-scan register cells, each with a serial-in, serial-out, parallel-in, and parallel-out pin. The serial pins are used to serially connect all the boundary-scan register cells in a device into a boundary-scan register chain, which starts at the TDI pin and ends at the TDO pin. The parallel ports are connected to the internal core logic tile and the input, output and control ports of an I/O buffer to capture and load data into the register to control or observe the logic state of each I/O.

Figure 14 • 42MX IEEE 1149.1 Boundary Scan Circuitry

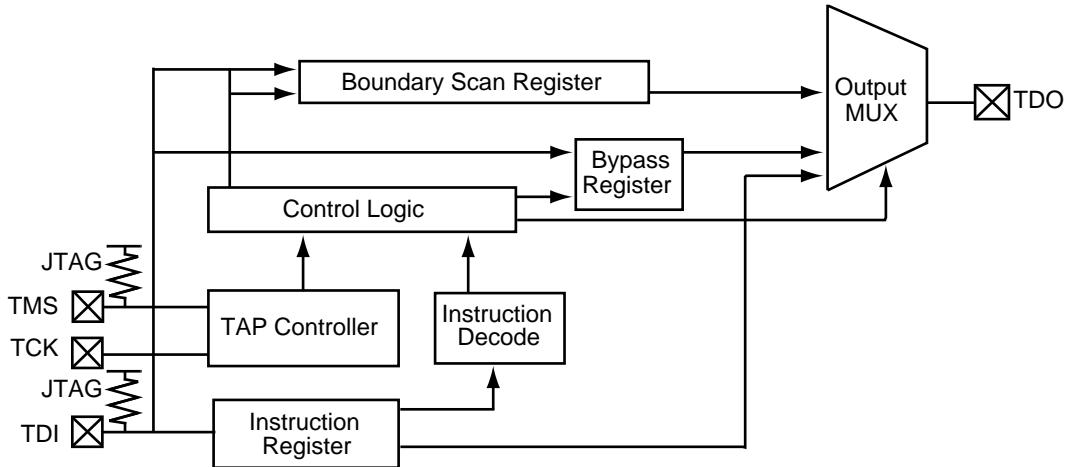

Table 9 • Test Access Port Descriptions

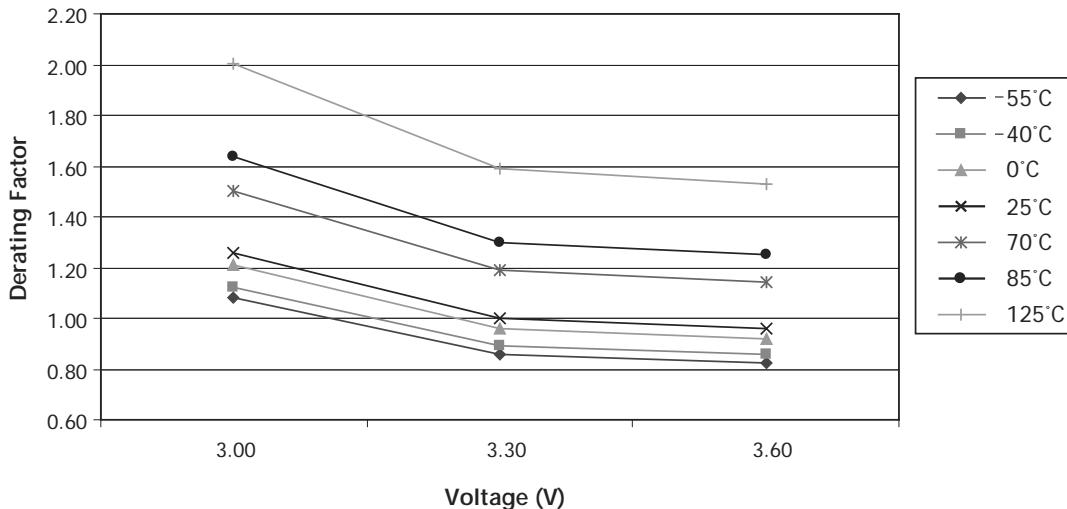

Port	Description
TMS (Test Mode Select)	Serial input for the test logic control bits. Data is captured on the rising edge of the test logic clock (TCK).
TCK (Test Clock Input)	Dedicated test logic clock used serially to shift test instruction, test data, and control inputs on the rising edge of the clock, and serially to shift the output data on the falling edge of the clock. The maximum clock frequency for TCK is 20 MHz.
TDI (Test Data Input)	Serial input for instruction and test data. Data is captured on the rising edge of the test logic clock.
TDO (Test Data Output)	Serial output for test instruction and data from the test logic. TDO is set to an Inactive Drive state (high impedance) when data scanning is not in progress.

Table 10 • Supported BST Public Instructions

Instruction	IR Code (IR2.IR0)	Instruction Type	Description
EXTEST	000	Mandatory	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
SAMPLE/PRELOAD	001	Mandatory	Allows a snapshot of the signals at the device pins to be captured and examined during operation
HIGH Z	101	Optional	Tristates all I/Os to allow external signals to drive pins. See the IEEE Standard 1149.1 specification.
CLAMP	110	Optional	Allows state of signals driven from component pins to be determined from the Boundary-Scan Register. See the IEEE Standard 1149.1 specification for details.
BYPASS	111	Mandatory	Enables the bypass register between the TDI and TDO pins. The test data passes through the selected device to adjacent devices in the test chain.

Table 31 • 40MX Temperature and Voltage Derating Factors (Normalized to $T_J = 25^\circ\text{C}$, $V_{CC} = 3.3\text{ V}$)

		Temperature						
40MX Voltage	-55°C	-40°C	0°C	25°C	70°C	85°C	125°C	
3.60	0.83	0.85	0.92	0.96	1.14	1.25	1.53	

Figure 37 • 40MX Junction Temperature and Voltage Derating Curves (Normalized to $T_J = 25^\circ\text{C}$, $V_{CC} = 3.3\text{ V}$)

Note: This derating factor applies to all routing and propagation delays

3.11.5 PCI System Timing Specification

The following tables list the critical PCI timing parameters and the corresponding timing parameters for the MX PCI-compliant devices.

3.11.6 PCI Models

Microsemi provides synthesizable VHDL and Verilog-HDL models for a PCI Target interface, a PCI Target and Target+DMA Master interface. Contact the Microsemi sales representative for more details.

Table 32 • Clock Specification for 33 MHz PCI

Symbol	Parameter	PCI		A42MX24		A42MX36		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
t_{CYC}	CLK Cycle Time	30	—	4.0	—	4.0	—	ns

- For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
- Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
- Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
- Delays based on 35 pF loading.

t _{LSU}	I/O Latch Set-Up		0.7		0.7		0.8		1.0		1.4 ns
t _{LH}	I/O Latch Hold		0.0		0.0		0.0		0.0		ns
t _{LCO}	I/O Latch Clock-to-Out (Pad-to-Pad) 32 I/O		7.9		8.8		10.0		11.8		16.5 ns

1. For dual-module macros, use t_{PD1} + t_{RD1} + t_{PDn}, t_{CO} + t_{RD1} + t_{PDn}, or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. *Set-up and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*
5. Delays based on 35 pF loading.

3.12 Pin Descriptions

This section lists the pin descriptions for 40MX and 42MX series FPGAs.

CLK/A/B, I/O Global Clock

Clock inputs for clock distribution networks. CLK is for 40MX while CLKA and CLKB are for 42MX devices. The clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

DCLK, I/O Diagnostic Clock

Clock input for diagnostic probe and device programming. DCLK is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

GND, Ground

Input LOW supply voltage.

I/O, Input/Output

Clock signal to shift the Boundary Scan Test (BST) data into the device. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDI, I/OTest Data In

Serial data input for BST instructions and data. Data is shifted in on the rising edge of TCK. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TDO, I/OTest Data Out

Serial data output for BST instructions and test data. This pin functions as an I/O when "Reserve JTAG" is not checked in the Designer Software. BST pins are only available in A42MX24 and A42MX36 devices.

TMS, I/OTest Mode Select

The TMS pin controls the use of the IEEE 1149.1 Boundary Scan pins (TCK, TDI, TDO). In flexible mode when the TMS pin is set LOW, the TCK, TDI and TDO pins are boundary scan pins. Once the boundary scan pins are in test mode, they will remain in that mode until the internal boundary scan state machine reaches the "logic reset" state. At this point, the boundary scan pins will be released and will function as regular I/O pins. The "logic reset" state is reached 5 TCK cycles after the TMS pin is set HIGH. In dedicated test mode, TMS functions as specified in the IEEE 1149.1 specifications. IEEE JTAG specification recommends a 10kΩ pull-up resistor on the pin. BST pins are only available in A42MX24 and A42MX36 devices.

VCC, Supply Voltage

Input supply voltage for 40MX devices

VCCA, Supply Voltage

Supply voltage for array in 42MX devices

VCCI, Supply Voltage

Supply voltage for I/Os in 42MX devices

WD, IOWide Decode Output

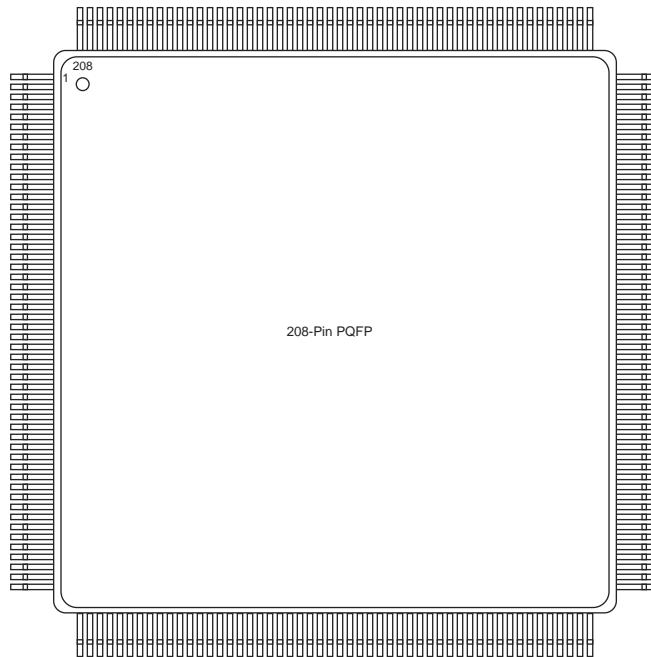

When a wide decode module is used in a 42MX device this pin can be used as a dedicated output from the wide decode module. This direct connection eliminates additional interconnect delays associated with regular logic modules. To implement the direct I/O connection, connect an output buffer of any type to the output of the wide decode macro and place this output on one of the reserved WD pins.
