### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	72
Number of Gates	36000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-1plg84i">https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-1plg84i</a>

## 2 40MX and 42MX FPGA Families

---

### 2.1 Features

The following sections list out various features of the 40MX and 42MX FPGA family devices.

#### 2.1.1 High Capacity

- Single-Chip ASIC Alternative
- 3,000 to 54,000 System Gates
- Up to 2.5 kbits Configurable Dual-Port SRAM
- Fast Wide-Decode Circuitry
- Up to 202 User-Programmable I/O Pins

#### 2.1.2 High Performance

- 5.6 ns Clock-to-Out
- 250 MHz Performance
- 5 ns Dual-Port SRAM Access
- 100 MHz FIFOs
- 7.5 ns 35-Bit Address Decode

#### 2.1.3 HiRel Features

- Commercial, Industrial, Automotive, and Military Temperature Plastic Packages
- Commercial, Military Temperature, and MIL-STD-883 Ceramic Packages
- QML Certification
- Ceramic Devices Available to DSCC SMD

#### 2.1.4 Ease of Integration

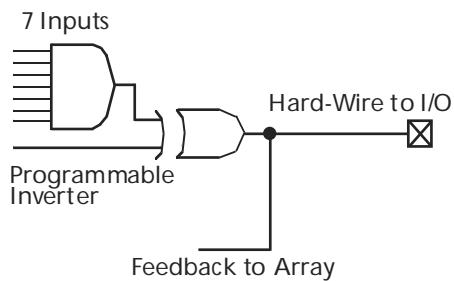

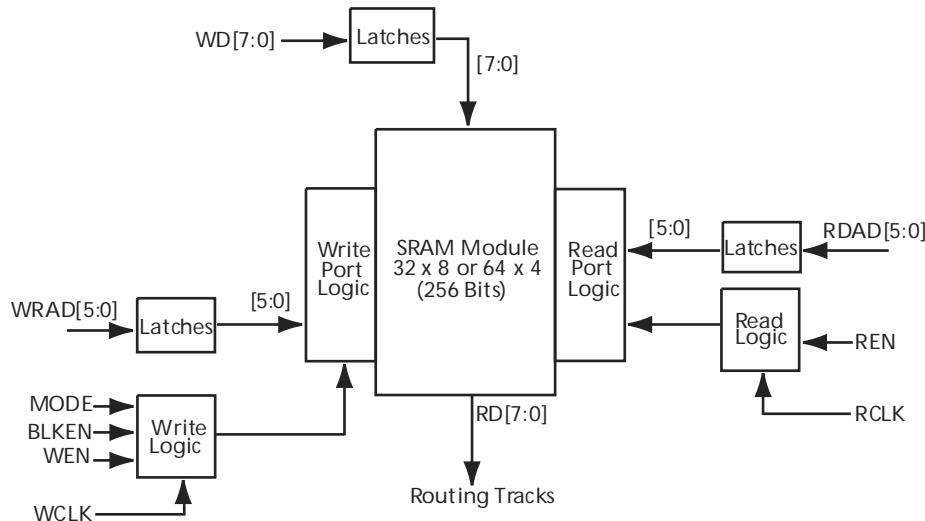

- Mixed-Voltage Operation (5.0 V or 3.3 V for core and I/Os), with PCI-Compliant I/Os
- Up to 100% Resource Utilization and 100% Pin Locking
- Deterministic, User-Controllable Timing
- Unique In-System Diagnostic and Verification Capability with Silicon Explorer II
- Low Power Consumption
- IEEE Standard 1149.1 (JTAG) Boundary Scan Testing

## 2.2 Product Profile

The following table gives the features of the products.

**Table 1 • Product profile**

Device	A40MX02	A40MX04	A42MX09	A42MX16	A42MX24	A42MX36
<b>Capacity</b>						
System Gates	3,000	6,000	14,000	24,000	36,000	54,000
SRAM Bits	—	—	—	—	—	2,560
<b>Logic Modules</b>						
Sequential	—	—	348	624	954	1,230
Combinatorial	295	547	336	608	912	1,184
Decode	—	—	—	—	24	24
<b>Clock-to-Out</b>						
	9.5 ns	9.5 ns	5.6 ns	6.1 ns	6.1 ns	6.3 ns
<b>SRAM Modules (64x4 or 32x8)</b>						
	—	—	—	—	—	10
<b>Dedicated Flip-Flops</b>						
	—	—	348	624	954	1,230

**Figure 5 • A42MX24 and A42MX36 D-Module Implementation****Figure 6 • A42MX36 Dual-Port SRAM Block**

### 3.2.3 Routing Structure

The MX architecture uses vertical and horizontal routing tracks to interconnect the various logic and I/O modules. These routing tracks are metal interconnects that may be continuous or split into segments. Varying segment lengths allow the interconnect of over 90% of design tracks to occur with only two antifuse connections. Segments can be joined together at the ends using antifuses to increase their lengths up to the full length of the track. All interconnects can be accomplished with a maximum of four antifuses.

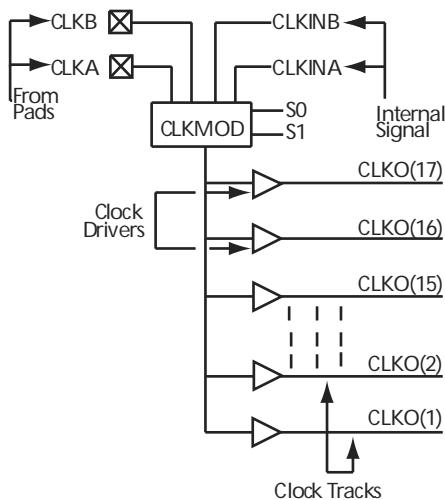

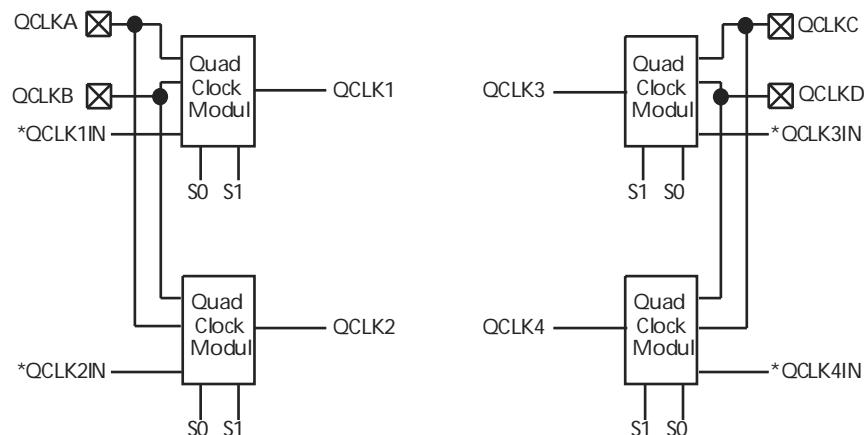

#### 3.2.3.1 Horizontal Routing

Horizontal routing tracks span the whole row length or are divided into multiple segments and are located in between the rows of modules. Any segment that spans more than one-third of the row length is considered a long horizontal segment. A typical channel is shown in Figure 7, page 10. Within horizontal routing, dedicated routing tracks are used for global clock networks and for power and ground tie-off tracks. Non-dedicated tracks are used for signal nets.

#### 3.2.3.2 Vertical Routing

Another set of routing tracks run vertically through the module. There are three types of vertical tracks: input, output, and long. Long tracks span the column length of the module, and can be divided into multiple segments. Each segment in an input track is dedicated to the input of a particular module; each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing.

Each output segment spans four channels (two above and two below), except near the top and bottom of the array, where edge effects occur. Long vertical tracks contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 7, page 10.

**Figure 8 • Clock Networks of 42MX Devices****Figure 9 • Quadrant Clock Network of A42MX36 Devices**

**Note:** \*QCLK1IN, QCLK2IN, QCLK3IN, and QCLK4IN are internally-generated signals.

### 3.2.5 MultiPlex I/O Modules

42MX devices feature Multiplex I/Os and support 5.0 V, 3.3 V, and mixed 3.3 V/5.0 V operations.

The MultiPlex I/O modules provide the interface between the device pins and the logic array. Figure 10, page 12 is a block diagram of the 42MX I/O module. A variety of user functions, determined by a library macro selection, can be implemented in the module. (See the *Antifuse Macro Library Guide* for more information.) All 42MX I/O modules contain tristate buffers, with input and output latches that can be configured for input, output, or bidirectional operation.

All 42MX devices contain flexible I/O structures, where each output pin has a dedicated output-enable control (Figure 10, page 12). The I/O module can be used to latch input or output data, or both, providing fast set-up time. In addition, the Designer software tools can build a D-type flip-flop using a C-module combined with an I/O module to register input and output signals. See the *Antifuse Macro Library Guide* for more details.

A42MX24 and A42MX36 devices also offer selectable PCI output drives, enabling 100% compliance with version 2.1 of the PCI specification. For low-power systems, all inputs and outputs are turned off to reduce current consumption to below 500  $\mu$ A.

To achieve 5.0 V or 3.3 V PCI-compliant output drives on A42MX24 and A42MX36 devices, a chip-wide PCI fuse is programmed via the Device Selection Wizard in the Designer software (Figure 11, page 12). When the PCI fuse is not programmed, the output drive is standard.

Silicon Sculptor programs devices independently to achieve the fastest programming times possible. After being programmed, each fuse is verified to insure that it has been programmed correctly. Furthermore, at the end of programming, there are integrity tests that are run to ensure no extra fuses have been programmed. Not only does it test fuses (both programmed and non-programmed), Silicon Sculptor also allows self-test to verify its own hardware extensively.

The procedure for programming an MX device using Silicon Sculptor is as follows:

1. Load the \*.AFM file
2. Select the device to be programmed
3. Begin programming

When the design is ready to go to production, Microsemi offers device volume-programming services either through distribution partners or via In-House Programming from the factory.

For more details on programming MX devices, see the *AC225: Programming Antifuse Devices* application note and the *Silicon Sculptor 3 Programmers User Guide*.

### 3.3.4 Power Supply

MX devices are designed to operate in both 5.0V and 3.3V environments. In particular, 42MX devices can operate in mixed 5.0 V/3.3 V systems. The following table describes the voltage support of MX devices.

**Table 6 • Voltage Support of MX Devices**

Device	VCC	VCCA	VCCI	Maximum Input Tolerance	Nominal Output Voltage
40MX	5.0 V	—	—	5.5 V	5.0 V
	3.3 V	—	—	3.6 V	3.3 V
42MX	—	5.0 V	5.0 V	5.5 V	5.0 V
	—	3.3 V	3.3 V	3.6 V	3.3 V
	—	5.0 V	3.3 V	5.5 V	3.3 V

For A42MX24 and A42MX36 devices the VCCA supply has to be monotonic during power up in order for the POR to issue reset to the JTAG state machine correctly. For more information, see the *AC291: 42MX Family Devices Power-Up Behavior*.

### 3.3.5 Power-Up/Down in Mixed-Voltage Mode

When powering up 42MX in mixed voltage mode (VCCA = 5.0 V and VCCI = 3.3 V), VCCA must be greater than or equal to VCCI throughout the power-up sequence. If VCCI exceeds VCCA during power-up, one of two things will happen:

- The input protection diode on the I/Os will be forward biased
- The I/Os will be at logical High

In either case, ICC rises to high levels. For power-down, any sequence with VCCA and VCCI can be implemented.

### 3.3.6 Transient Current

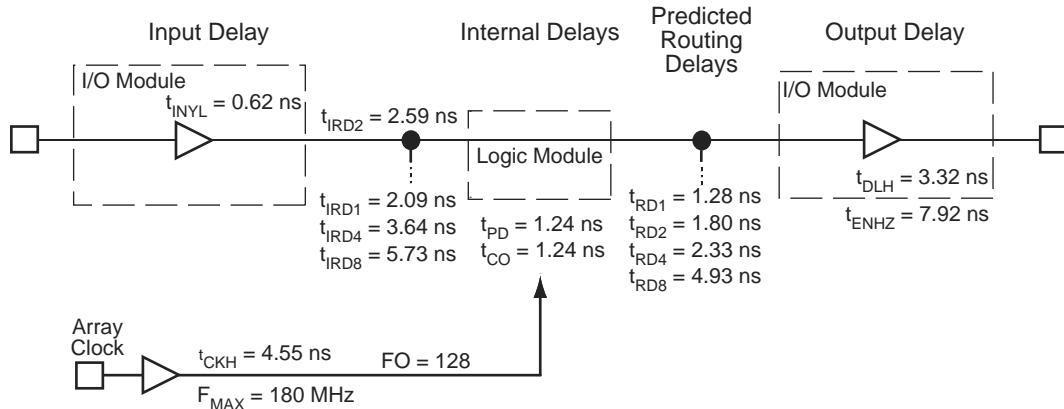

Due to the simultaneous random logic switching activity during power-up, a transient current may appear on the core supply (VCC). Customers must use a regulator for the VCC supply that can source a minimum of 100 mA for transient current during power-up. Failure to provide enough power can prevent the system from powering up properly and result in functional failure. However, there are no reliability concerns, since transient current is distributed across the die instead of confined to a localized spot.

Since the transient current is not due to I/O switching, its value and duration are independent of the VCCI.

### 3.10 Timing Models

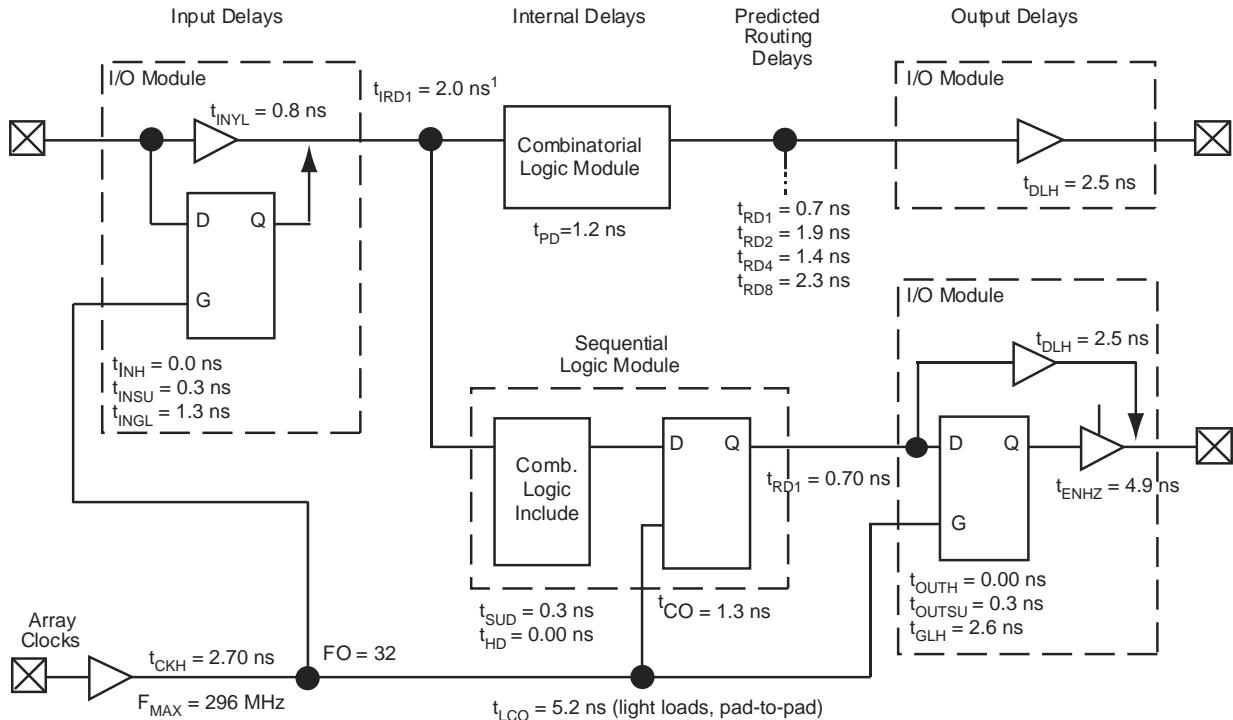

The following figures show various timing models.

**Figure 17 • 40MX Timing Model\***

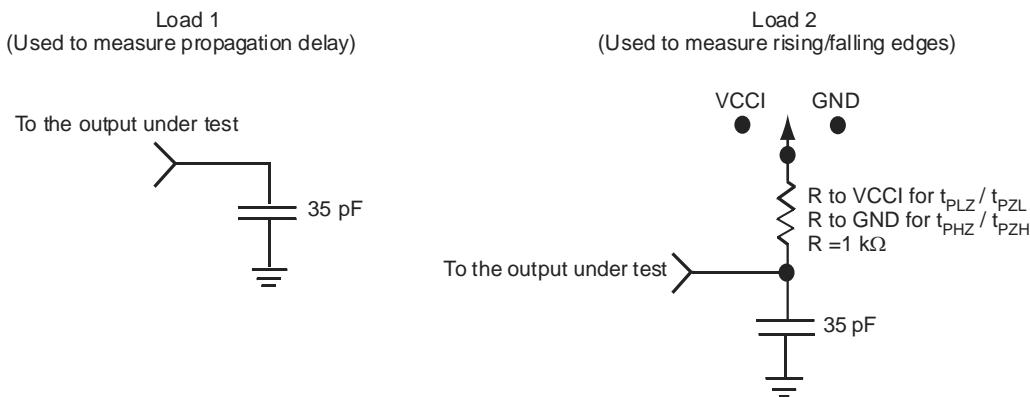

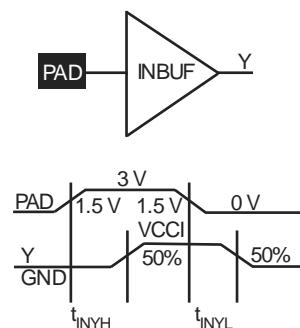

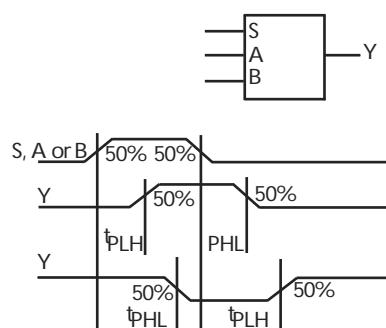

**Note:** Values are shown for 40MX –3 speed devices at 5.0 V worst-case commercial conditions.

**Figure 18 • 42MX Timing Model**

**Note:** 1. Input module predicted routing delay

**Note:** 2. Values are shown for A42MX09 –3 at 5.0 V worst-case commercial conditions.

**Figure 22 • AC Test Loads****Figure 23 • Input Buffer Delays****Figure 24 • Module Delays**

approximately a 3 ns to a 6 ns delay, which is represented statistically in higher fanout (FO=8) routing delays in the data sheet specifications section, shown in Table 34, page 41.

### 3.11.3 Timing Derating

MX devices are manufactured with a CMOS process. Therefore, device performance varies according to temperature, voltage, and process changes. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature and worst-case processing.

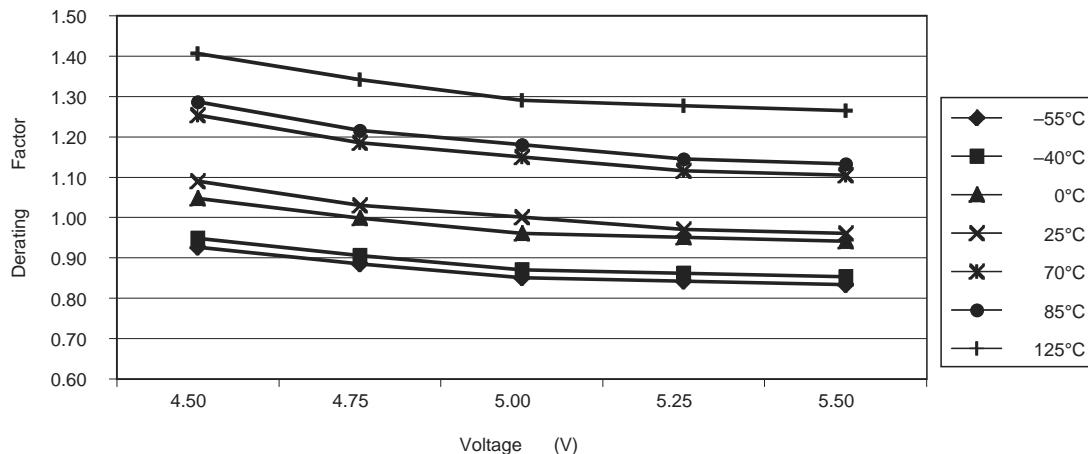

### 3.11.4 Temperature and Voltage Derating Factors

The following tables and figures show temperature and voltage derating factors for 40MX and 42MX FPGAs.

**Table 28 • 42MX Temperature and Voltage Derating Factors (Normalized to  $T_J = 25^\circ\text{C}$ ,  $VCCA = 5.0 \text{ V}$ )**

Temperature								
42MX Voltage	-55°C	-40°C	0°C	25°C	70°C	85°C	125°C	
4.50	0.93	0.95	1.05	1.09	1.25	1.29	1.41	
4.75	0.88	0.90	1.00	1.03	1.18	1.22	1.34	
5.00	0.85	0.87	0.96	1.00	1.15	1.18	1.29	
5.25	0.84	0.86	0.95	0.97	1.12	1.14	1.28	
5.50	0.83	0.85	0.94	0.96	1.10	1.13	1.26	

**Figure 34 • 42MX Junction Temperature and Voltage Derating Curves (Normalized to  $T_J = 25^\circ\text{C}$ ,  $VCCA = 5.0 \text{ V}$ )**

**Note:** This derating factor applies to all routing and propagation delays

**Table 29 • 40MX Temperature and Voltage Derating Factors (Normalized to  $T_J = 25^\circ\text{C}$ ,  $VCC = 5.0 \text{ V}$ )**

Temperature								
40MX Voltage	-55°C	-40°C	0°C	25°C	70°C	85°C	125°C	
4.50	0.89	0.93	1.02	1.09	1.25	1.31	1.45	
4.75	0.84	0.88	0.97	1.03	1.18	1.24	1.37	
5.00	0.82	0.85	0.94	1.00	1.15	1.20	1.33	
5.25	0.80	0.82	0.91	0.97	1.12	1.16	1.29	
5.50	0.79	0.82	0.90	0.96	1.10	1.15	1.28

1. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance
2. Set-up times assume fanout of 3. Further testing information can be obtained from the Timer utility
3. The hold time for the DFME1A macro may be greater than 0 ns. Use the Timer tool from the Designer software to check the hold time for this macro.
4. Delays based on 35pF loading
