### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	176
Number of Gates	36000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-1pqg208m">https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-1pqg208m</a>

## 2 40MX and 42MX FPGA Families

### 2.1 Features

The following sections list out various features of the 40MX and 42MX FPGA family devices.

#### 2.1.1 High Capacity

- Single-Chip ASIC Alternative
- 3,000 to 54,000 System Gates
- Up to 2.5 kbits Configurable Dual-Port SRAM
- Fast Wide-Decode Circuitry
- Up to 202 User-Programmable I/O Pins

#### 2.1.2 High Performance

- 5.6 ns Clock-to-Out
- 250 MHz Performance
- 5 ns Dual-Port SRAM Access
- 100 MHz FIFOs
- 7.5 ns 35-Bit Address Decode

#### 2.1.3 HiRel Features

- Commercial, Industrial, Automotive, and Military Temperature Plastic Packages
- Commercial, Military Temperature, and MIL-STD-883 Ceramic Packages
- QML Certification
- Ceramic Devices Available to DSCC SMD

#### 2.1.4 Ease of Integration

- Mixed-Voltage Operation (5.0 V or 3.3 V for core and I/Os), with PCI-Compliant I/Os
- Up to 100% Resource Utilization and 100% Pin Locking
- Deterministic, User-Controllable Timing
- Unique In-System Diagnostic and Verification Capability with Silicon Explorer II
- Low Power Consumption
- IEEE Standard 1149.1 (JTAG) Boundary Scan Testing

### 2.2 Product Profile

The following table gives the features of the products.

**Table 1 • Product profile**

Device	A40MX02	A40MX04	A42MX09	A42MX16	A42MX24	A42MX36
<b>Capacity</b>						
System Gates	3,000	6,000	14,000	24,000	36,000	54,000
SRAM Bits	–	–	–	–	–	2,560
<b>Logic Modules</b>						
Sequential	–	–	348	624	954	1,230
Combinatorial	295	547	336	608	912	1,184
Decode	–	–	–	–	24	24
<b>Clock-to-Out</b>	9.5 ns	9.5 ns	5.6 ns	6.1 ns	6.1 ns	6.3 ns
<b>SRAM Modules (64x4 or 32x8)</b>						
	–	–	–	–	–	10
<b>Dedicated Flip-Flops</b>	–	–	348	624	954	1,230

## 2.6 Temperature Grade Offerings

### 3.2.3 Routing Structure

The MX architecture uses vertical and horizontal routing tracks to interconnect the various logic and I/O modules. These routing tracks are metal interconnects that may be continuous or split into segments. Varying segment lengths allow the interconnect of over 90% of design tracks to occur with only two antifuse connections. Segments can be joined together at the ends using antifuses to increase their lengths up to the full length of the track. All interconnects can be accomplished with a maximum of four antifuses.

#### 3.2.3.1 Horizontal Routing

Horizontal routing tracks span the whole row length or are divided into multiple segments and are located in between the rows of modules. Any segment that spans more than one-third of the row length is considered a long horizontal segment. A typical channel is shown in Figure 7, page 10. Within horizontal routing, dedicated routing tracks are used for global clock networks and for power and ground tie-off tracks. Non-dedicated tracks are used for signal nets.

#### 3.2.3.2 Vertical Routing

Another set of routing tracks run vertically through the module. There are three types of vertical tracks: input, output, and long. Long tracks span the column length of the module, and can be divided into multiple segments. Each segment in an input track is dedicated to the input of a particular module; each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing.

Each output segment spans four channels (two above and two below), except near the top and bottom of the array, where edge effects occur. Long vertical tracks contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 7, page 10.

### 3.3.7 Low Power Mode

42MX devices have been designed with a Low Power Mode. This feature, activated with setting the special LP pin to HIGH for a period longer than 800 ns, is particularly useful for battery-operated systems where battery life is a primary concern. In this mode, the core of the device is turned off and the device consumes minimal power with low standby current. In addition, all input buffers are turned off, and all outputs and bidirectional buffers are tristated. Since the core of the device is turned off, the states of the registers are lost. The device must be re-initialized when exiting Low Power Mode. I/Os can be driven during LP mode, and clock pins should be driven HIGH or LOW and should not float to avoid drawing current. To exit LP mode, the LP pin must be pulled LOW for over 200  $\mu$ s to allow for charge pumps to power up, and device initialization will begin.

## 3.4 Power Dissipation

The general power consumption of MX devices is made up of static and dynamic power and can be expressed with the following equation.

### 3.4.1 General Power Equation

$$P = [ICC_{\text{standby}} + ICC_{\text{active}}] * V_{\text{CCI}} + I_{\text{OL}} * V_{\text{OL}} * N + I_{\text{OH}} * (V_{\text{CCI}} - V_{\text{OH}}) * M$$

EQ 1

where:

- $ICC_{\text{standby}}$  is the current flowing when no inputs or outputs are changing.
- $ICC_{\text{active}}$  is the current flowing due to CMOS switching.
- $I_{\text{OL}}$ ,  $I_{\text{OH}}$  are TTL sink/source currents.
- $V_{\text{OL}}$ ,  $V_{\text{OH}}$  are TTL level output voltages.
- $N$  equals the number of outputs driving TTL loads to  $V_{\text{OL}}$ .
- $M$  equals the number of outputs driving TTL loads to  $V_{\text{OH}}$ .

Accurate values for  $N$  and  $M$  are difficult to determine because they depend on the family type, on design details, and on the system I/O. The power can be divided into two components: static and active.

### 3.4.2 Static Power Component

The static power due to standby current is typically a small component of the overall power consumption. Standby power is calculated for commercial, worst-case conditions. The static power dissipation by TTL loads depends on the number of outputs driving, and on the DC load current. For instance, a 32-bit bus sinking 4mA at 0.33V will generate 42mW with all outputs driving LOW, and 140mW with all outputs driving HIGH. The actual dissipation will average somewhere in between, as I/Os switch states with time.

### 3.4.3 Active Power Component

Power dissipation in CMOS devices is usually dominated by the dynamic power dissipation. Dynamic power consumption is frequency-dependent and is a function of the logic and the external I/O. Active power dissipation results from charging internal chip capacitances of the interconnect, unprogrammed antifuses, module inputs, and module outputs, plus external capacitances due to PC board traces and load device inputs. An additional component of the active power dissipation is the totem pole current in the CMOS transistor pairs. The net effect can be associated with an equivalent capacitance that can be combined with frequency and voltage to represent active power dissipation.

The power dissipated by a CMOS circuit can be expressed by the equation:

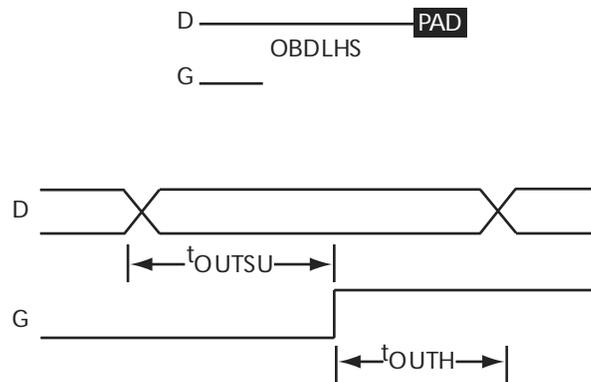

$$\text{Power}(\mu\text{W}) = C_{\text{EQ}} * V_{\text{CCA}}^2 * F(1)$$

EQ 2

where:

- $C_{\text{EQ}}$  = Equivalent capacitance expressed in picofarads (pF)

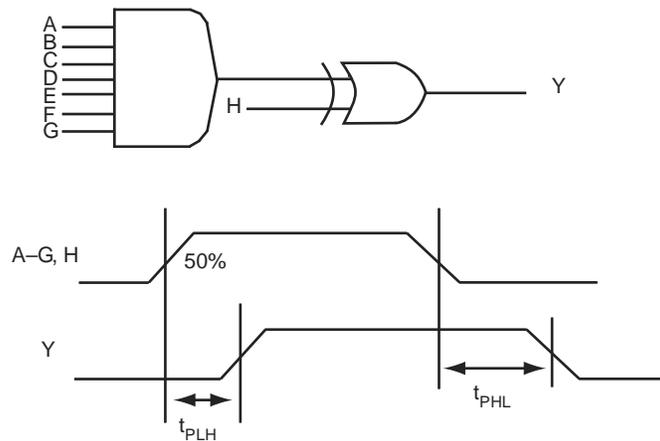

**Figure 27 • Output Buffer Latches**

### 3.10.4 Decode Module Timing

The following figure shows decode module timing.

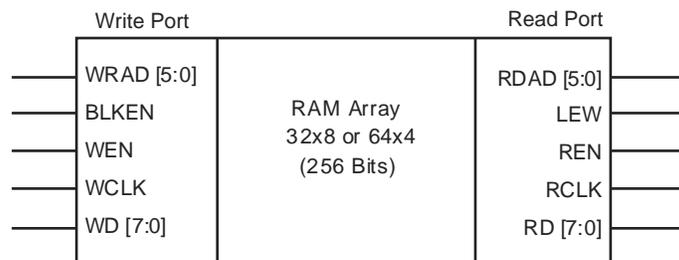

**Figure 28 • Decode Module Timing**

### 3.10.5 SRAM Timing Characteristics

The following figure shows SRAM timing characteristics.

**Figure 29 • SRAM Timing Characteristics**

### 3.10.6 Dual-Port SRAM Timing Waveforms

The following figures show dual-port SRAM timing waveforms.

**Table 37 • A40MX04 Timing Characteristics (Nominal 3.3 V Operation) (continued)(Worst-Case Commercial Conditions, VCC = 3.0 V, T<sub>J</sub> = 70°C)**

Parameter / Description	–3 Speed		–2 Speed		–1 Speed		Std Speed		–F Speed		Units
	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
<b>CMOS Output Module Timing<sup>4</sup></b>											
t <sub>DLH</sub>	Data-to-Pad HIGH	5.5	6.4	7.2	8.5	11.9	ns				
t <sub>DHL</sub>	Data-to-Pad LOW	4.8	5.5	6.2	7.3	10.2	ns				
t <sub>ENZH</sub>	Enable Pad Z to HIGH	4.7	5.5	6.2	7.3	10.2	ns				
t <sub>ENZL</sub>	Enable Pad Z to LOW	6.8	7.9	8.9	10.5	14.7	ns				
t <sub>ENHZ</sub>	Enable Pad HIGH to Z	11.1	12.8	14.5	17.1	23.9	ns				
t <sub>ENLZ</sub>	Enable Pad LOW to Z	8.2	9.5	10.7	12.6	17.7	ns				
d <sub>TLH</sub>	Delta LOW to HIGH	0.05	0.05	0.06	0.07	0.10	ns/pF				
d <sub>THL</sub>	Delta HIGH to LOW	0.03	0.03	0.04	0.04	0.06	ns/pF				

1. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
2. Set-up times assume fanout of 3. Further testing information can be obtained from the Timer utility.
3. The hold time for the DFME1A macro may be greater than 0 ns. Use the Timer tool from the Designer software to check the hold time for this macro.
4. Delays based on 35 pF loading.
