Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

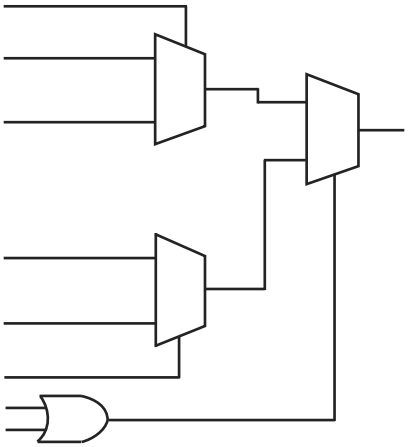
Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	125
Number of Gates	36000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-fpqg160

Figure 2 • **42MX C-Module Implementation**



The 42MX devices contain three types of logic modules: combinatorial (C-modules), sequential (S-modules) and decode (D-modules). The following figure illustrates the combinatorial logic module. The S-module, shown in Figure 4, page 8, implements the same combinatorial logic function as the C-module while adding a sequential element. The sequential element can be configured as either a D-flip-flop or a transparent latch. The S-module register can be bypassed so that it implements purely combinatorial logic.

3.11.5 PCI System Timing Specification

The following tables list the critical PCI timing parameters and the corresponding timing parameters for the MX PCI-compliant devices.

3.11.6 PCI Models

Microsemi provides synthesizable VHDL and Verilog-HDL models for a PCI Target interface, a PCI Target and Target+DMA Master interface. Contact the Microsemi sales representative for more details.

Table 32 • **Clock Specification for 33 MHz PCI**

		PCI		A42MX24		A42MX36

1. For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, point and position whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.*
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading

		FO = 486	5.1		5.7		6.2		7.1		11.9		ns

Input, output, tristate or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/Os pins are configured by the Designer software as shown in Table 46, page 84.

Table 46 • **Configuration of Unused I/Os**

Device	Configuration
A40MX02, A40MX04	Pulled LOW
A42MX09, A42MX16	Pulled LOW
A42MX24, A42MX36	Tristated

In all cases, it is recommended to tie all unused MX I/O pins to LOW on the board. This applies to all dual-purpose pins when configured as I/Os as well.

LP, Low Power Mode

Controls the low power mode of all 42MX devices. The device is placed in the low power mode by connecting the LP pin to logic HIGH. In low power mode, all I/Os are tristated, all input buffers are turned OFF, and the core of the device is turned OFF. To exit the low power mode, the LP pin must be set LOW. The device enters the low power mode 800 ns after the LP pin is driven to a logic HIGH. It will resume normal operation in 200 µs after the LP pin is driven to a logic LOW.

MODE, Mode

Controls the use of multifunction pins (DCLK, PRA, PRB, SDI, TDO). The MODE pin is held HIGH to provide verification capability. The MODE pin should be terminated to GND through a 10kΩ resistor so that the MODE pin can be pulled HIGH when required.

NC, No Connection

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

PRA, I/O

PRB, I/OProbe A/B

The Probe pin is used to output data from any user-defined design node within the device. Each diagnostic pin can be used in conjunction with the other probe pin to allow real-time diagnostic output of any signal path within the device. The Probe pin can be used as a user-defined I/O when verification has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. The Probe pin is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

QCLKA/B/C/D, I/O Quadrant Clock

Quadrant clock inputs for A42MX36 devices. When not used as a register control signal, these pins can function as user I/Os.

SDI, I/OSerial Data Input

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDO, I/OSerial Data Output

Serial data output for diagnostic probe and device programming. SDO is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW. SDO is available for 42MX devices only.

When Silicon Explorer II is being used, SDO will act as an output while the "checksum" command is run. It will return to user I/O when "checksum" is complete.

TCK, I/O Test Clock

4 Package Pin Assignments

The following figures and tables give the details of the package pin assignments.
