[Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

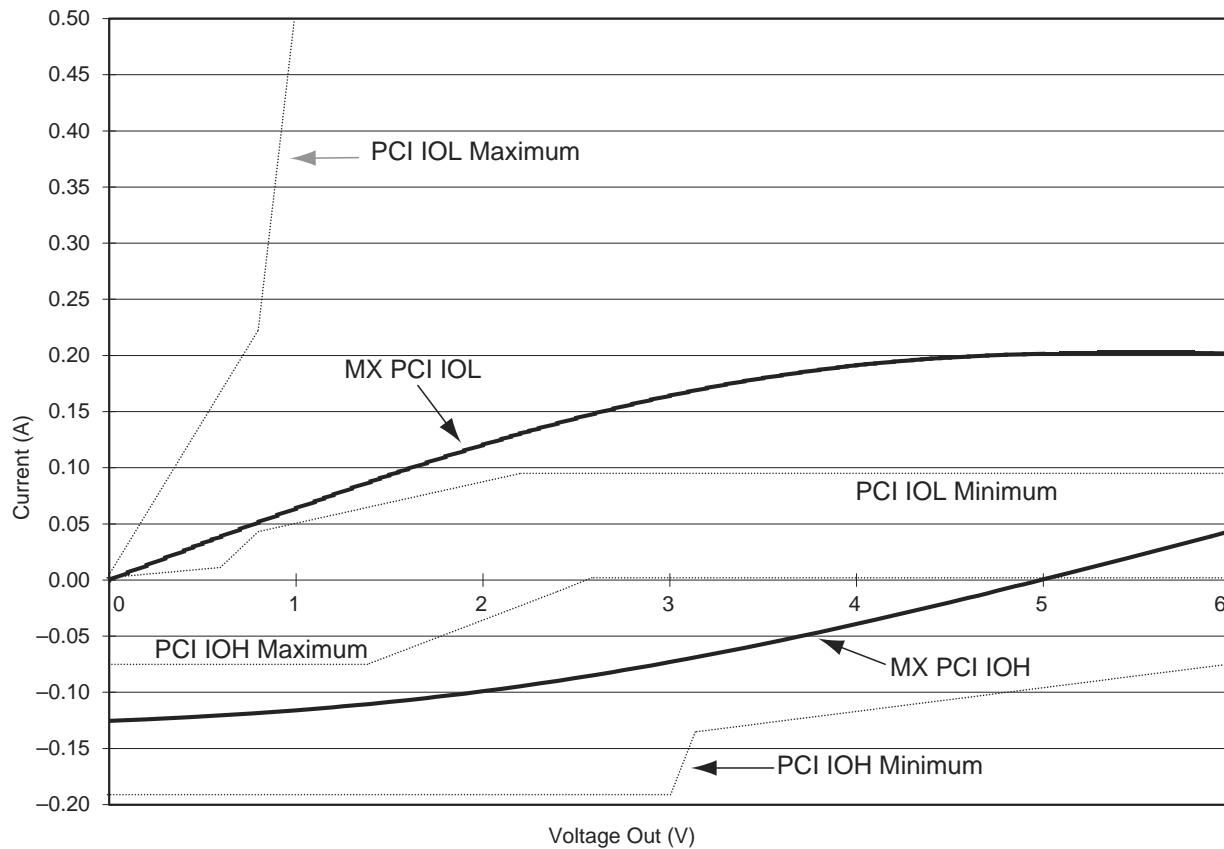

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	150
Number of Gates	36000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 125°C (TA)
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx24-tgg176a

Figure 16 • Typical Output Drive Characteristics (Based Upon Measured Data)

3.9.4 Junction Temperature (T_J)

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. The following equation can be used to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a(1)$$

EQ 4

where:

- T_a = Ambient Temperature
- ΔT = Temperature gradient between junction (silicon) and ambient
- $\Delta T = \theta_{ja} * P$ (2)
- P = Power
- θ_{ja} = Junction to ambient of package. θ_{ja} numbers are located in Table 27, page 29.

3.9.5 Package Thermal Characteristics

The device junction-to-case thermal characteristic is θ_{jc} , and the junction-to-ambient air characteristic is θ_{ja} . The thermal characteristics for θ_{ja} are shown with two different air flow rates.

The maximum junction temperature is 150°C.

Maximum power dissipation for commercial- and industrial-grade devices is a function of θ_{ja} .

A sample calculation of the absolute maximum power dissipation allowed for a TQ176 package at commercial temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (\text{°C}) - \text{Max} \cdot \text{ambient temp} \cdot (\text{°C})}{\theta_{ja}(\text{°C/W})} = \frac{150\text{°C} - 70\text{°C}}{(28\text{°C})/\text{W}} = 2.86\text{W}$$

EQ 5

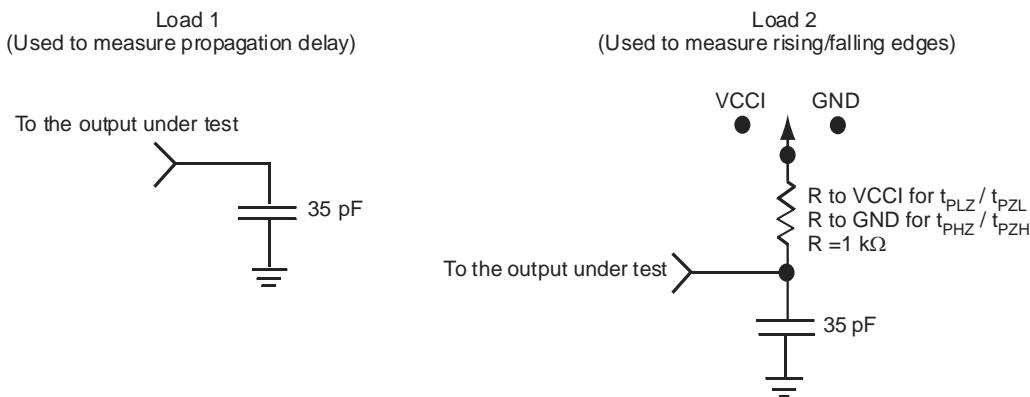

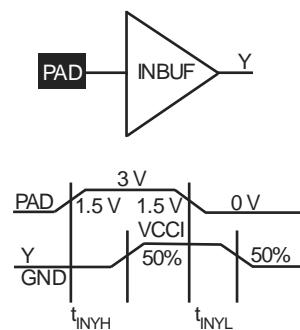

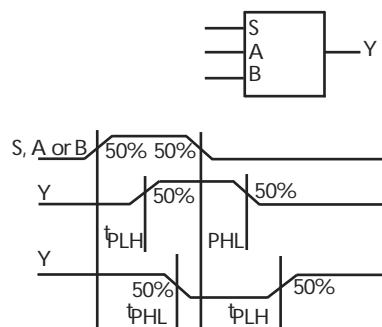

The maximum power dissipation for military-grade devices is a function of θ_{jc} . A sample calculation of the absolute maximum power dissipation allowed for CQFP 208-pin package at military temperature and still air is given in the following equation

$$\text{MaximumPowerAllowed} = \frac{\text{Max} \cdot \text{junction temp} \cdot (\text{°C}) - \text{Max} \cdot \text{ambient temp} \cdot (\text{°C})}{\theta_{jc}(\text{°C/W})} = \frac{150\text{°C} - 125\text{°C}}{(6.3\text{°C})/\text{W}} = 3.97\text{W}$$

EQ 6

Table 27 • Package Thermal Characteristics

1. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance
2. Set-up times assume fanout of 3. Further testing information can be obtained from the Timer utility
3. The hold time for the DFME1A macro may be greater than 0 ns. Use the Timer tool from the Designer software to check the hold time for this macro.
4. Delays based on 35pF loading

d _{T LH}	Capacitive Loading, LOW to HIGH	0.03	0.03	0.03	0.04	0.06	ns/pF				

1. For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, point and position whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the input buffer latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading

Table 41 • A42MX16 Timing Characteristics (Nominal 3.3 V Operation) (Worst-Case Commercial Conditions, VCCA = 3.0 V, TJ = 70°C)
