

Welcome to [E-XFL.COM](#)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	2560
Number of I/O	202
Number of Gates	54000
Voltage - Supply	3V ~ 3.6V, 4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	272-BBGA
Supplier Device Package	272-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a42mx36-bg272

3 40MX and 42MX FPGAs

3.1 General Description

Microsemi's 40MX and 42MX families offer a cost-effective design solution at 5V. The MX devices are single-chip solutions and provide high performance while shortening the system design and development cycle. MX devices can integrate and consolidate logic implemented in multiple PALs, CPLDs, and FPGAs. Example applications include high-speed controllers and address decoding, peripheral bus interfaces, DSP, and co-processor functions.

The MX device architecture is based on Microsemi's patented antifuse technology implemented in a 0.45 μ m triple-metal CMOS process. With capacities ranging from 3,000 to 54,000 system gates, the MX devices provide performance up to 250 MHz, are live on power-up and have one-fifth the standby power consumption of comparable FPGAs. MX FPGAs provide up to 202 user I/Os and are available in a wide variety of packages and speed grades.

A42MX24 and A42MX36 devices also feature multiPlex I/Os, which support mixed-voltage systems, enable programmable PCI, deliver high-performance operation at both 5.0V and 3.3V, and provide a low-power mode. The devices are fully compliant with the PCI local bus specification (version 2.1). They deliver 200 MHz on-chip operation and 6.1 ns clock-to-output performance.

The 42MX24 and 42MX36 devices include system-level features such as IEEE Standard 1149.1 (JTAG) Boundary Scan Testing and fast wide-decode modules. In addition, the A42MX36 device offers dual-port SRAM for implementing fast FIFOs, LIFOs, and temporary data storage. The storage elements can efficiently address applications requiring wide data path manipulation and can perform transformation functions such as those required for telecommunications, networking, and DSP.

All MX devices are fully tested over automotive and military temperature ranges. In addition, the largest member of the family, the A42MX36, is available in both CQ208 and CQ256 ceramic packages screened to MIL-STD-883 levels. For easy prototyping and conversion from plastic to ceramic, the CQ208 and PQ208 devices are pin-compatible.

3.2 MX Architectural Overview

The MX devices are composed of fine-grained building blocks that enable fast, efficient logic designs. All devices within these families are composed of logic modules, I/O modules, routing resources and clock networks, which are the building blocks for fast logic designs. In addition, the A42MX36 device contains embedded dual-port SRAM modules, which are optimized for high-speed data path functions such as FIFOs, LIFOs and scratch pad memory. A42MX24 and A42MX36 also contain wide-decode modules.

3.2.1 Logic Modules

The 40MX logic module is an eight-input, one-output logic circuit designed to implement a wide range of logic functions with efficient use of interconnect routing resources.(see the following figure).

The logic module can implement the four basic logic functions (NAND, AND, OR and NOR) in gates of two, three, or four inputs. The logic module can also implement a variety of D-latches, exclusivity functions, AND-ORs and OR-ANDs. No dedicated hard-wired latches or flip-flops are required in the array; latches and flip-flops can be constructed from logic modules whenever required in the application.

reliability. Devices should not be operated outside the recommended operating conditions.

Table 21 • Recommended Operating Conditions

Parameter	Commercial	Industrial	Military	Units
Temperature Range*	0 to +70	-40 to +85	-55 to +125	°C
VCCA	4.75 to 5.25	4.5 to 5.5	4.5 to 5.5	V
VCCI	3.14 to 3.47	3.0 to 3.6	3.0 to 3.6	V

Note: *Ambient temperature (T_A) is used for commercial and industrial grades; case temperature (T_C) is used for military grades.

Table 23 • DC Specification (5.0 V PCI Signaling)¹

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
C _{IN}	Input Pin Capacitance			10	—	10	pF
C _{CLK}	CLK Pin Capacitance		5	12	—	10	pF
L _{PIN}	Pin Inductance			20	—	< 8 nH ⁴	nH

1. PCI Local Bus Specification, Version 2.1, Section 4.2.1.1.

2. Maximum rating for VCCI –0.5 V to 7.0 V

3. VIH(Min) is 2.4V for A42MX36 family. This applies only to VCCI of 5V and is not applicable to VCCI of 3.3V.

4. Dependent upon the chosen package. PCI recommends QFP and BGA packaging to reduce pin inductance and capacitance.

Table 24 • AC Specifications (5.0V PCI Signaling)*

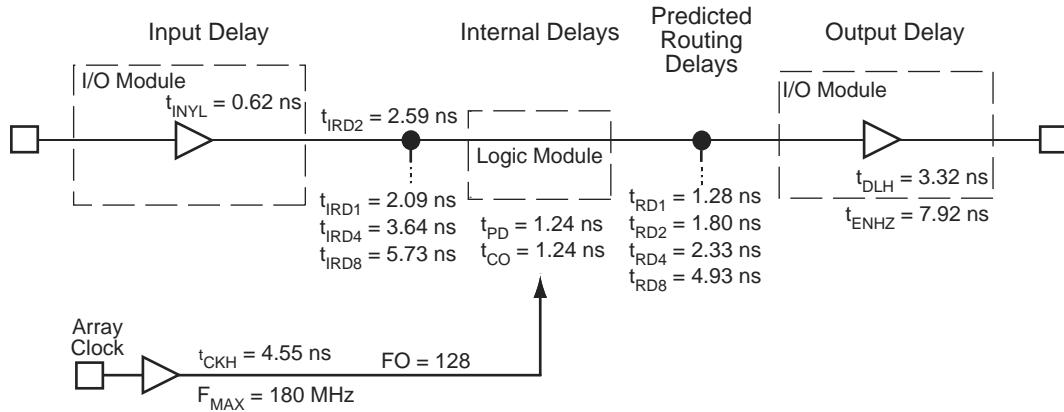

Symbol	Parameter	Condition	PCI		MX		Units
			Min.	Max.	Min.	Max.	
ICL	Low Clamp Current	–5 < VIN ≤ –1	–25 + (VIN +1) /0.015		–60	–10	mA
Slew (r)	Output Rise Slew Rate	0.4 V to 2.4 V load	1		5	1.8	2.8
Slew (f)	Output Fall Slew Rate	2.4 V to 0.4 V load	1		5	2.8	4.3
					V/ns	V/ns	

Note: *PCI Local Bus Specification, Version 2.1, Section 4.2.1.2.

3.10 Timing Models

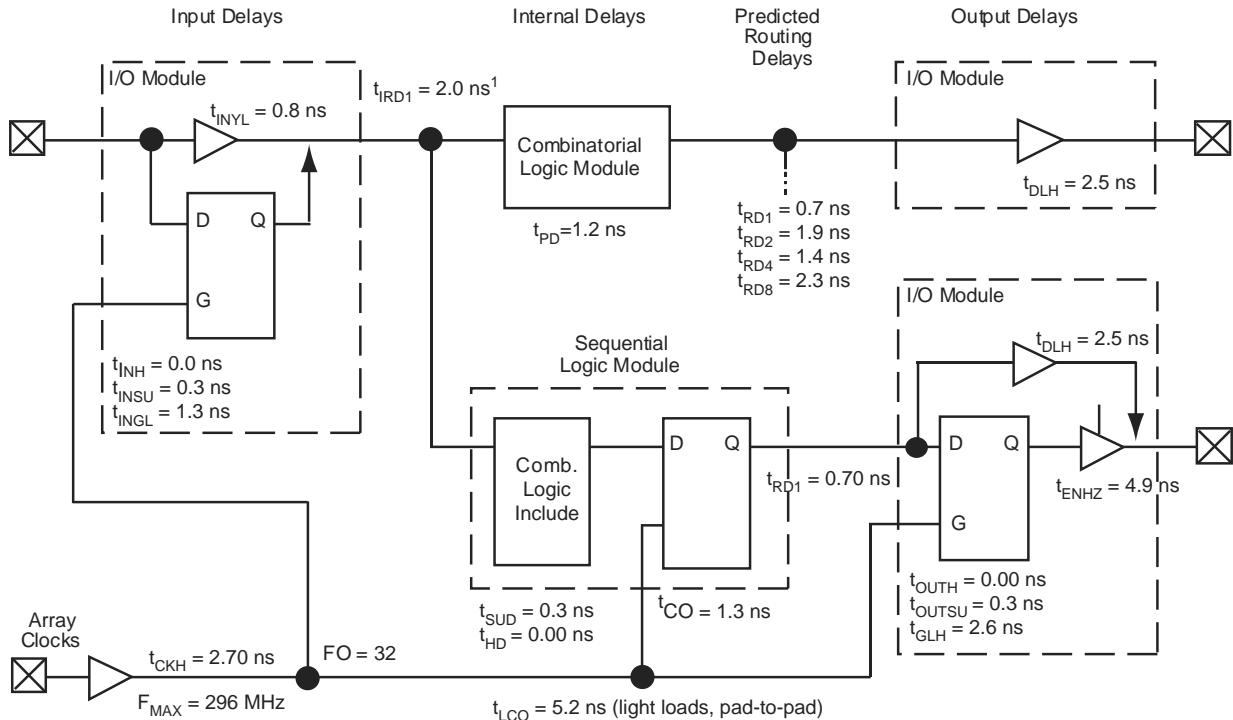

The following figures show various timing models.

Figure 17 • 40MX Timing Model*

Note: Values are shown for 40MX –3 speed devices at 5.0 V worst-case commercial conditions.

Figure 18 • 42MX Timing Model

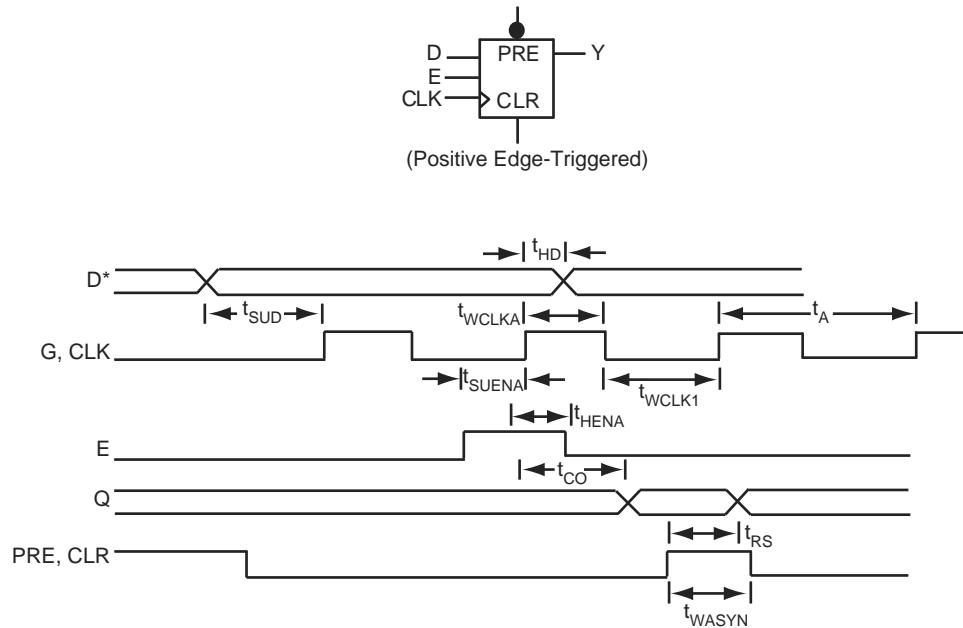

Note: 1. Input module predicted routing delay

Note: 2. Values are shown for A42MX09 –3 at 5.0 V worst-case commercial conditions.

3.10.2 Sequential Module Timing Characteristics

The following figure shows sequential module timing characteristics.

Figure 25 • Flip-Flops and Latches

Note: *D represents all data functions involving A, B, and S for multiplexed flip-flops.

3.10.3 Sequential Timing Characteristics

The following figures show sequential timing characteristics.

Figure 26 • Input Buffer Latches

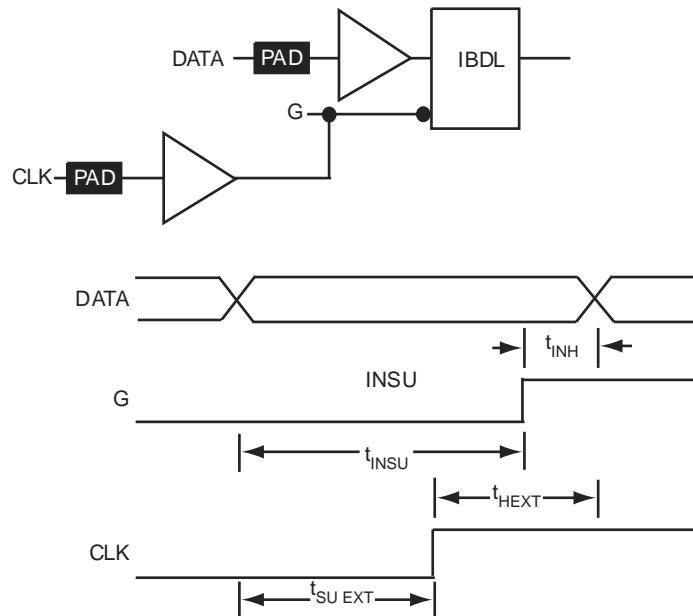

Table 34 • A40MX02 Timing Characteristics (Nominal 5.0 V Operation) (continued)
(Worst-Case Commercial Conditions, VCC = 4.75 V, TJ = 70°C)

t _{ILA}	Latch Active Pulse Width	6.5	7.3	8.2	9.7	13.5	ns				

Input, output, tristate or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/Os pins are configured by the Designer software as shown in Table 46, page 84.

Table 46 • Configuration of Unused I/Os

Device	Configuration
A40MX02, A40MX04	Pulled LOW
A42MX09, A42MX16	Pulled LOW
A42MX24, A42MX36	Tristated

In all cases, it is recommended to tie all unused MX I/O pins to LOW on the board. This applies to all dual-purpose pins when configured as I/Os as well.

LP, Low Power Mode

Controls the low power mode of all 42MX devices. The device is placed in the low power mode by connecting the LP pin to logic HIGH. In low power mode, all I/Os are tristated, all input buffers are turned OFF, and the core of the device is turned OFF. To exit the low power mode, the LP pin must be set LOW. The device enters the low power mode 800 ns after the LP pin is driven to a logic HIGH. It will resume normal operation in 200 μ s after the LP pin is driven to a logic LOW.

MODE, Mode

Controls the use of multifunction pins (DCLK, PRA, PRB, SDI, TDO). The MODE pin is held HIGH to provide verification capability. The MODE pin should be terminated to GND through a 10k Ω resistor so that the MODE pin can be pulled HIGH when required.

NC, No Connection

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

PRA, I/O

PRB, I/OProbe A/B

The Probe pin is used to output data from any user-defined design node within the device. Each diagnostic pin can be used in conjunction with the other probe pin to allow real-time diagnostic output of any signal path within the device. The Probe pin can be used as a user-defined I/O when verification has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. The Probe pin is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

QCLKA/B/C/D, I/O Quadrant Clock

Quadrant clock inputs for A42MX36 devices. When not used as a register control signal, these pins can function as user I/Os.

SDI, I/OSerial Data Input

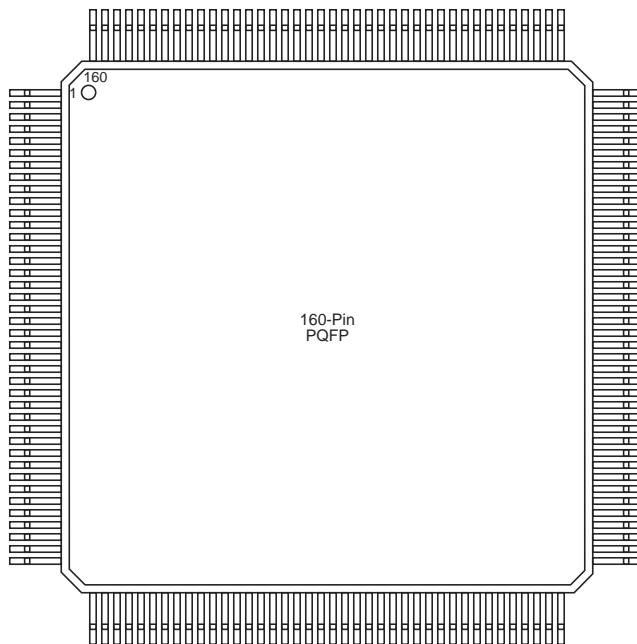

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDO, I/OSerial Data Output

Serial data output for diagnostic probe and device programming. SDO is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW. SDO is available for 42MX devices only.

When Silicon Explorer II is being used, SDO will act as an output while the "checksum" command is run. It will return to user I/O when "checksum" is complete.

TCK, I/O Test Clock
