Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MIPS-II
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	100MHz
Co-Processors/DSP	-
RAM Controllers	SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	-
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 70°C (TA)
Security Features	-
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/idt79rc32v333-100dhg

- 2KB of 2-way set associative data cache, capable of write-back and write-through operation.
- Cache locking per line to speed real-time systems and critical system functions
- On-chip TLB to enable multi-tasking in modern operating systems
- EJTAG interface to enable sophisticated low-cost in-circuit emulation.

Synchronous-DRAM Interface

The RC32333 integrates a SDRAM controller which provides direct control of system SyncDRAM running at speeds to 75MHz.

Key capabilities of the SDRAM controller include:

- Direct control of 4 banks of SDRAM (up to 2 64-bit wide DIMMs)
- On-chip page comparators optimize access latency.
- Speeds to 75MHz
- Programmable address map.
- Supports 16, 64, 128, 256, or 512Mb SDRAM devices
- Automatic refresh generation driven by on-chip timer
- Support for discrete devices, SODIMM, or DIMM modules.

Thus, systems can take advantage of the full range of commodity memory that is available, enabling system optimization for cost, real-estate, or other attributes.

Local Memory and I/O Controller

The local memory and I/O controller implements direct control of external memory devices, including the boot ROM as well as other memory areas, and also implements direct control of external peripherals.

The local memory controller is highly flexible, allowing a wide range of devices to be directly controlled by the RC32333 processor. For example, a system can be built using an 8-bit boot ROM, 16-bit FLASH cards (possibly on PCMCIA), a 32-bit SRAM or dual-port memory, and a variety of low-cost peripherals.

Key capabilities include:

- Direct control of EPROM, FLASH, RAM, and dual-port memories
- 6 chip-select outputs, supporting up to 8MB per memory space
- Supports mixture of 8-, 16-, and 32-bit wide memory regions
- Flexible timing protocols allow direct control of a wide variety of devices
- Programmable address map for 2 chip selects
- Automatic wait state generation.

PCI Bus Bridge

In order to leverage the wide availability of low-cost peripherals for the PC market as well as to simplify the design of add-in functions, the RC32333 integrates a full 32-bit PCI bus bridge. Key attributes of this bridge include:

- 50 MHz operation
- PCI revision 2.2 compliant
- Programmable address mappings between CPU/Local memory and PCI memory and I/O
- On-chip PCI arbiter
- Extensive buffering allows PCI to operate concurrently with local memory transfers
- Selectable byte-ordering swapper.

On-Chip DMA Controller

To minimize CPU exception handling and maximize the efficiency of system bandwidth, the RC32333 integrates a very sophisticated 4-channel DMA controller on chip.

The RC32333 DMA controller is capable of:

- Chaining and scatter/gather support through the use of a flexible, linked list of DMA transaction descriptors
- Capable of memory<->memory, memory<->I/O, and PCI<->memory DMA
- Unaligned transfer support
- Byte, halfword, word, quadword DMA support.

On-Chip Peripherals

The RC32333 also integrates peripherals that are common to a wide variety of embedded systems.

- Single 16550 compatible UART.
- SPI master mode interface for direct interface to EEPROM, A/D, etc.
- Interrupt Controller to speed interrupt decode and management
- Four 32-bit on-chip Timer/Counters
- Programmable I/O module

Debug Support

To facilitate rapid time to market, the RC32333 provides extensive support for system debug.

First and foremost, this product integrates an EJTAG in-circuit emulation module, allowing a low-cost emulator to interoperate with programs executing on the controller. By using an augmented JTAG interface, the RC32333 is able to reuse the same low-cost emulators developed around the RC32364 CPU.

Secondly, the RC32333 implements additional reporting signals intended to simplify the task of system debugging when using a logic analyzer. This product allows the logic analyzer to differentiate transactions initiated by DMA from those initiated by the CPU and further allows CPU transactions to be sorted into instruction fetches vs. data fetches.

Finally, the RC32333 implements a full boundary scan capability, allowing board manufacturing diagnostics and debug.

Packaging

The RC32333 is packaged using a 208 Quad Flat Pack (QFP) package.

Thermal Considerations

The RC32333 consumes less than 2.0 W peak power. The device is guaranteed in an ambient temperature range of 0° to +70° C for commercial temperature devices; -40° to +85° C for industrial temperature devices.

Revision History

March 5, 2003: Initial publication of 2.5V Revision X silicon.

September 2, 2003: Added 2.5V version of device. Changed tables to include 2.5V values where appropriate. Added a Power Consumption table, Temperature and Voltage table, and Power Curves for the 2.5V device. In the PCI category of Table 6, created separate sections for 3.3V and 2.5V devices and in 2.5V section changed time to 4 ns for pci_cbe_n[3:0], pci_frame_n, pci_trdy_n, and pci_irdy_n. In Table 8, added 3 new categories (Input Pads, PCI Input Pads, and All Pads) and added footnotes 2 and 3. In Table 13, pins 181 and 184 were changed from Vcc Core to Vcc I/O.

March 24, 2004: In Table 1, changed description in Satellite Mode for pci_rst_n. Specified "cold" reset on pages 12 and 13. Changed several values in Table 12, Absolute Maximum Ratings, and changed footnote 1 to that table.

May 4, 2004: Revised values in Table 11, Power Consumption — 2.5V Device.

Pin Description Table

The following table lists the pins provided on the RC32333. Note that those pin names followed by "_n" are active-low signals. All external pull-ups and pull-downs require 10 kΩ resistor.

Name	Type	Reset State Status	Drive Strength Capability	Description
Local System Interface				
mem_data[31:0]	I/O	Z	High	**Local system data bus** Primary data bus for memory. I/O and SDRAM.
mem_addr[22:2]	I/O	[22:10] Z [9:2] L	[22:17] Low [16:2] High	**Memory Address Bus** These signals provide the Memory or DRAM address, during a Memory or DRAM bus transaction. During each word data, the address increments either in linear or sub-block ordering, depending on the transaction type. The table below indicates how the memory write enable signals are used to address discreet memory port width types.

Port Width	Pin Signals mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]
DMA (32-bit)	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]
32-bit	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]
16-bit	Byte High Write Enable	mem_addr[1]	Not Used (Driven Low)	Byte Low Write Enable
8-bit	Not Used (Driven High)	mem_addr[1]	mem_addr[0]	Byte Write Enable

mem_addr[22] Alternate function: reset_boot_mode[1].
mem_addr[21] Alternate function: reset_boot_mode[0].
mem_addr[20] Alternate function: reset_pci_host_mode.
mem_addr[19] Alternate function: modebit [9].
mem_addr[18] Alternate function: modebit [8].
mem_addr[17] Alternate function: modebit [7].
mem_addr[16] Alternate function: sdram_addr[16].
mem_addr[15] Alternate function: sdram_addr[15].
mem_addr[14] Alternate function: sdram_addr[14].
mem_addr[13] Alternate function: sdram_addr[13].
mem_addr[11] Alternate function: sdram_addr[11].
mem_addr[10] Alternate function: sdram_addr[10].
mem_addr[9] Alternate function: sdram_addr[9].
mem_addr[8] Alternate function: sdram_addr[8].
mem_addr[7] Alternate function: sdram_addr[7].
mem_addr[6] Alternate function: sdram_addr[6].
mem_addr[5] Alternate function: sdram_addr[5].
mem_addr[4] Alternate function: sdram_addr[4].
mem_addr[3] Alternate function: sdram_addr[3].
mem_addr[2] Alternate function: sdram_addr[2].

Name	Type	Reset State Status	Drive Strength Capability	Description
mem_cs_n[5:0]	Output	H	Low	**Memory Chip Select Negated** Recommend an external pull-up. Signals that a Memory Bank is actively selected.
mem_oe_n	Output	H	High	**Memory Output Enable Negated** Recommend an external pull-up. Signals that a Memory Bank can output its data lines onto the cpu_ad bus.
mem_we_n[3:0]	Output	H	High	**Memory Write Enable Negated Bus** Signals which bytes are to be written during a memory transaction. Bits act as Byte Enable and mem_addr[1:0] signals for 8-bit or 16-bit wide addressing.

Table 1   Pin Descriptions (Part 1 of 6)

Name	Type	Reset State Status	Drive Strength Capability	Description
mem_wait_n	Input		—	**Memory Wait Negated** Requires an external pull-up. SRAM/IOI/IOM modes: Allows external wait-states to be injected during the last cycle before data is sampled. DPM (dual-port) mode: Allows dual-port busy signal to restart memory transaction. Alternate function: sdram_wait_n.
mem_245_oe_n	Output	H	Low	**Memory FCT245 Output Enable Negated** Controls output enable to optional FCT245 transceiver bank by asserting during both reads and writes to a memory or I/O bank.
mem_245_dt_r_n	Output	Z	High	**Memory FCT245 Direction Xmit/Rcv Negated** Recommend an external pull-up. Alternate function: cpu_dt_r_n. See CPU Core Specific Signals below.
output_clk	Output	cpu_masterclk	High	**Output Clock** Optional clock output.

PCI Interface

Name	Type	Reset State Status	Drive Strength Capability	Description
pci_ad[31:0]	I/O	Z	PCI	**PCI Multiplexed Address/Data Bus** Address driven by Bus Master during initial frame_n assertion, and then the Data is driven by the Bus Master during writes; or the Data is driven by the Bus Slave during reads.
pci_cbe_n[3:0]	I/O	Z	PCI	**PCI Multiplexed Command/Byte Enable Bus** Command (not negated) Bus driven by the Bus Master during the initial frame_n assertion. Byte Enable Negated Bus driven by the Bus Master during the data phase(s).
pci_par	I/O	Z	PCI	**PCI Parity** Even parity of the pci_ad[31:0] bus. Driven by Bus Master during Address and Write Data phases. Driven by the Bus Slave during the Read Data phase.
pci_frame_n	I/O	Z	PCI	**PCI Frame Negated** Driven by the Bus Master. Assertion indicates the beginning of a bus transaction. De-assertion indicates the last datum.
pci_trdy_n	I/O	Z	PCI	**PCI Target Ready Negated** Driven by the Bus Slave to indicate the current datum can complete.
pci_irdy_n	I/O	Z	PCI	**PCI Initiator Ready Negated** Driven by the Bus Master to indicate that the current datum can complete.
pci_stop_n	I/O	Z	PCI	**PCI Stop Negated** Driven by the Bus Slave to terminate the current bus transaction.
pci_idsel_n	Input		—	**PCI Initialization Device Select** Uses pci_req_n[2] pin. See the PCI subsection.
pci_perr_n	I/O	Z	PCI	**PCI Parity Error Negated** Driven by the receiving Bus Agent 2 clocks after the data is received, if a parity error occurs.
pci_serr_n	I/O Open-collector	Z	PCI	**System Error** Requires an external pull-up. Driven by any agent to indicate an address parity error, data parity during a Special Cycle command, or any other system error.
pci_clk	Input		—	**PCI Clock** Clock for PCI Bus transactions. Uses the rising edge for all timing references.
pci_rst_n	Input	L	—	**PCI Reset Negated** Host mode: Resets all PCI related logic. Satellite mode: Resets all PCI related logic and also warm resets the 32333.
pci_devsel_n	I/O	Z	PCI	**PCI Device Select Negated** Driven by the target to indicate that the target has decoded the present address as a target address.

Table 1 Pin Descriptions (Part 2 of 6)

Name	Type	Reset State Status	Drive Strength Capability	Description
pci_req_n[2]	Input	Z	—	**PCI Bus Request #2 Negated** Requires an external pull-up. Host mode: pci_req_n[2] is an input indicating a request from an external device. Satellite mode: used as pci_idsel pin which selects this device during a configuration read or write. Alternate function: pci_idsel (satellite).
pci_req_n[1]	Input	Z	—	**PCI Bus Request #1 Negated** Requires external pull-up. Host mode: pci_req_n[1] is an input indicating a request from an external device. Alternate function: Unused (satellite).
pci_req_n[0]	I/O	Z	High	**PCI Bus Request #0 Negated** Requires an external pull-up for burst mode. Host mode: pci_req_n[0] is an input indicating a request from an external device. Satellite mode: pci_req_n[0] is an output indicating a request from this device.
pci_gnt_n[2]	Output	Z[1]	High	**PCI Bus Grant #2 Negated** Recommend an external pull-up. Host mode: pci_gnt_n[2] is an output indicating a grant to an external device. Satellite mode: pci_gnt_n[2] is used as the pci_inta_n output pin. External pull-up is required. Alternate function: pci_inta_n (satellite).
pci_gnt_n[1] / pci_eeprom_cs	I/O	X for 1 pci clock then H[2]	High	**PCI Bus Grant #1 Negated** Recommend external pull-up. Host mode: pci_gnt_n[1] is an output indicating a grant to an external device. Satellite mode: Used as pci_eprom_cs output pin for Serial Chip Select for loading PCI Configuration Registers in the RC32333 Reset Initialization Vector PCI boot mode. Defaults to the output direction at reset time. 1st Alternate function: pci_eeprom_cs (satellite). 2nd Alternate function: PIO[7].
pci_gnt_n[0]	I/O	Z	High	**PCI Bus Grant #0 Negated** Host mode: pci_gnt_n[0] is an output indicating a grant to an external device. Recommend external pull-up. Satellite mode: pci_gnt_n[0] is an input indicating a grant to this device. Requires external pull-up.
pci_inta_n	Output Open-collector	Z	PCI	**PCI Interrupt #A Negated** Uses pci_gnt_n[2]. See the PCI subsection.
pci_lock_n	Input		—	**PCI Lock Negated** Driven by the Bus Master to indicate that an exclusive operation is occurring.

[1] Z in host mode; L in satellite non-boot mode; Z in satellite boot mode.
[2] H in host mode, L in satellite non-boot and boot modes. X = unknown.

SDRAM Control Interface

Name	Type	Reset State Status	Drive Strength Capability	Description
sdram_addr_12	Output	L	High	**SDRAM Address Bit 12 and Precharge All** SDRAM mode: Provides SDRAM address bit 12 (10 on the SDRAM chip) during row address and "pre-charge all" signal during refresh, read and write command.
sdram_ras_n	Output	H	High	**SDRAM RAS Negated** SDRAM mode: Provides SDRAM RAS control signal to all SDRAM banks.
sdram_cas_n	Output	H	High	**SDRAM CAS Negated** SDRAM mode: Provides SDRAM CAS control signal to all SDRAM banks.
sdram_we_n	Output	H	High	**SDRAM WE Negated** SDRAM mode: Provides SDRAM WE control signal to all SDRAM banks.
sdram_cke	Output	H	High	**SDRAM Clock Enable** SDRAM mode: Provides clock enable to all SDRAM banks.

Table 1 Pin Descriptions (Part 3 of 6)

Name	Type	Reset State Status	Drive Strength Capability	Description
sdram_cs_n[3:0]	Output	H	High	**SDRAM Chip Select Negated Bus** Recommend an external pull-up. SDRAM mode: Provides chip select to each SDRAM bank. SODIMM mode: Provides upper select byte enables [7:4].
sdram_s_n[1:0]	Output	H	High	**SDRAM SODIMM Select Negated Bus** SDRAM mode: Not used. SDRAM SODIMM mode: Upper and lower chip selects.
sdram_bemask_n [3:0]	Output	H	High	**SDRAM Byte Enable Mask Negated Bus (DQM)** SDRAM mode: Provides byte enables for each byte lane of all DRAM banks. SODIMM mode: Provides lower select byte enables [3:0].
sdram_245_oe_n	Output	H	Low	**SDRAM FCT245 Output Enable Negated** Recommend an external pull-up. SDRAM mode: Controls output enable to optional FCT245 transceiver bank by asserting during both reads and writes to any DRAM bank.
sdram_245_dt_r_n	Output	Z	High	**SDRAM FCT245 Direction Transmit/Receive** Recommend an external pull-up. Uses cpu_dt_r_n. See CPU Core Specific Signals below.
On-Chip Peripherals				
dma_ready_n[0]	I/O	Z	Low	**DMA Ready Negated Bus** Requires an external pull-up. Ready mode: Input pin for general purpose DMA channel 0 that can initiate the next datum in the current DMA descriptor frame. Done mode: Input pin for general purpose DMA channel 0 that can terminate the current DMA descriptor frame. dma_ready_n[0] 1st Alternate function PIO[0]; 2nd Alternate function: dma_done_n[0].
pio[7:0]	I/O	See related pins	Low	**Programmable Input/Output** General purpose pins that can each can be configured as a general purpose input or general purpose output. These pins are multiplexed with other pin functions: pci_gnt_n[1] (pci_eeprom_cs), spi_mosi, spi_sck, spi_ss_n, spi_miso, uart_rx[0], uart_tx[0], dma_ready_n[0]. Note that pci_gnt_n[1], spi_mosi, spi_sck, and spi_ss_n default to outputs at reset time. The others default to inputs.
uart_rx[0]	I/O	Z	Low	**UART Receive Data Bus** UART mode: UART channel receive data. uart_rx[0] Alternate function: PIO[2].
uart_tx[0]	I/O	Z	Low	**UART Transmit Data Bus** Recommend an external pull-up. UART mode: UART channel send data. Note that this pin defaults to an input at reset time and must be programmed via the PIO interface before being used as a UART output. uart_tx[0] Alternate function: PIO[1].
spi_mosi	I/O	L	Low	**SPI Data Output** Serial mode: Output pin from RC32333 as an Input to a Serial Chip for the Serial data input stream. In PCI satellite mode, acts as an Output pin from RC32333 that connects as an Input to a Serial Chip for the Serial data input stream for loading PCI Configuration Registers in the RC32333 Reset Initialization Vector PCI boot mode. 1st Alternate function: PIO[6]. Defaults to the output direction at reset time. 2nd Alternate function: pci_eeprom_mdo.
spi_miso	I/O	Z	Low	**SPI Data Input** Serial mode: Input pin to RC32333 from the Output of a Serial Chip for the Serial data output stream. In PCI satellite mode, acts as an Input pin from RC32333 that connects as an output to a Serial Chip for the Serial data output stream for loading PCI Configuration Registers in the RC32333 Reset Initialization Vector PCI boot mode. Defaults to input direction at reset time. 1st Alternate function: PIO[3]. 2nd Alternate function: pci_eeprom_mdi.

Table 1 Pin Descriptions (Part 4 of 6)

Name	Type	Reset State Status	Drive Strength Capability	Description
spi_sck	I/O	L	Low	**SPI Clock** Serial mode: Output pin for Serial Clock. In PCI satellite mode, acts as an Output pin for Serial Clock for loading PCI Configuration Registers in the RC323333 Reset Initialization Vector PCI boot mode. 1st Alternate function: PIO[5]. Defaults to the output direction at reset time. 2nd Alternate function: pci_eeprom_sk.
spi_ss_n	I/O	H	Low	**SPI Chip Select** Output pin selecting the serial protocol device as opposed to the PCI satellite mode EEPROM device. Alternate function: PIO[4]. Defaults to the output direction at reset time.

CPU Core Specific Signals

Name	Type	Reset State Status	Drive Strength Capability	Description
cpu_nmi_n	Input		—	**CPU Non-Maskable Interrupt** Requires an external pull-up. This interrupt input is active low to the CPU.
cpu_masterclk	Input		—	**CPU Master System Clock** Provides the basic system clock.
cpu_int_n[1:0]	Input		—	**CPU Interrupt** Requires an external pull-up. These interrupt inputs are active low to the CPU.
cpu_coldreset_n	Input	L	—	**CPU Cold Reset** This active-low signal is asserted to the RC32333 after V_{cc} becomes valid on the initial power-up. The Reset initialization vectors for the RC32333 are latched by cold reset.
cpu_dt_r_n	Output	Z	—	**CPU Direction Transmit/Receive** This active-low signal controls the DT/R pin of an optional FCT245 transceiver bank. It is asserted during read operations. 1st Alternate function: mem_245_dt_r_n. 2nd Alternate function: sdram_245_dt_r_n.

JTAG Interface Signals

| Name	Type	Reset State Status	Drive Strength Capability	Description
jtag_tck	Input		—	**JTAG Test Clock** Requires an external pull-down. An input test clock used to shift into or out of the Boundary-Scan register cells. jtag_tck is independent of the system and the processor clock with nominal 50% duty cycle.
jtag_tdi, ejtag_dint_n	Input		—	**JTAG Test Data In** Requires an external pull-up. On the rising edge of jtag_tck, serial input data are shifted into either the Instruction or Data register, depending on the TAP controller state. During Real Mode, this input is used as an interrupt line to stop the debug unit from Real Time mode and return the debug unit back to Run Time Mode (standard JTAG). This pin is also used as the ejtag_dint_n signal in the EJTAG mode.
jtag_tdo, ejtag_tpc	Output	Z	High	**JTAG Test Data Out** The jtag_tdo is serial data shifted out from instruction or data register on the falling edge of jtag_tck. When no data is shifted out, the jtag_tdo is tri-stated. During Real Time Mode, this signal provides a non-sequential program counter at the processor clock or at a division of processor clock. This pin is also used as the ejtag_tpc signal in the EJTAG mode.
jtag_tms	Input		—	**JTAG Test Mode Select** Requires an external pull-up. The logic signal received at the jtag_tms input is decoded by the TAP controller to control test operation. jtag_tms is sampled on the rising edge of the jtag_tck.
jtag_trst_n	Input	L	—	**JTAG Test Reset** When neither JTAG nor EJTAG are being used, jtag_trst_n must be driven low (pulled down) or the jtag_tms/ejtag_tms signals must be pulled up and jtag_clk actively clocked.
ejtag_dclk	Output	Z	—	**EJTAG Test Clock** Processor Clock. During Real Time Mode, this signal is used to capture address and data from the ejtag_tpc signal at the processor clock speed or any division of the internal pipeline.

Table 1   Pin Descriptions (Part 5 of 6)

Name	Type	Reset State Status	Drive Strength Capability	Description
ejtag_pcst[2:0]	I/O	Z	Low	**EJTAG PC Trace Status Information** 111 (STL) Pipe line Stall 110 (JMP) Branch/Jump forms with PC output 101 (BRT) Branch/Jump forms with no PC output 100 (EXP) Exception generated with an exception vector code output 011 (SEQ) Sequential performance 010 (TST) Trace is outputted at pipeline stall time 001 (TSQ) Trace trigger output at performance time 000 (DBM) Run Debug Mode Alternate function: modebit[2:0].
ejtag_tms	Input		—	**EJTAG Test Mode Select** Requires an external pull-up. The ejtag_tms is sampled on the rising edge of jtag_tck.

Debug Signals

Name	Type	Reset State Status	Drive Strength Capability	Description
debug_cpu_dma_n	I/O	Z	Low	**Debug CPU versus DMA Negated** De-assertion high during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction was generated from the CPU. Assertion low during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction was generated from DMA. Alternate function: modebit[6].
debug_cpu_ack_n	I/O	Z	Low	**Debug CPU Acknowledge Negated** Indicates either a data acknowledge to the CPU or DMA. Alternate function: modebit[4].
debug_cpu_ads_n	I/O	Z	Low	**Debug CPU Address/Data Strobe Negated** Assertion indicates that either a CPU or a DMA transaction is beginning and that the mem_data[31:4] bus has the current block address. Alternate function: modebit[5].
debug_cpu_i_d_n	I/O	Z	Low	**Debug CPU Instruction versus Data Negated** Assertion during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction is a CPU or DMA data transaction. De-assertion during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction is a CPU instruction transaction. Alternate function: modebit[3].

pci_host_mode Settings

During cold reset initialization, the RC32333's PCI interface can be set to the Satellite or Host mode settings. When set to the Host mode, the CPU must configure the RC32333's PCI configuration registers, including the read-only registers. If the RC32333's PCI is in the PCI-boot mode Satellite mode, read-only configuration registers are loaded by the serial EEPROM.

Pin	Reset Boot Mode	Description	Value	Mode Settings
mem_addr[20]	PCI host mode	PCI is in satellite mode	1	PCI_satellite
		PCI is in host mode (typical system)	0	PCI_host

Table 5 Clock Parameters - RC32333

[1.] cpu_masterclock frequency should never be below pci_clk frequency if PCI interface is used.

[2.] Rise and Fall times are measured between 10% and 90%.

[3.] Output_clk should not be used in a system. Only the cpu_masterclock or its derivative must be used to drive all the subsystems with designs based on the RC3233x systems. Refer to the RC3233x Device Errata for more information.

Table 6 AC Timing Characteristics - RC32333 (Part 4 of 4)

[1.] At all pipeline frequencies.

[2.] Guaranteed by design.

[3.] This PCI interface conforms to the PCI Local Bus Specification, Rev 2.2 at 33MHz.

[4.] pci_rst_n is tested per PCI 2.2 as an asynchronous signal.

Standard EJTAG Timing — RC32333

Figure 4 represents the timing diagram for the EJTAG interface signals.

The standard JTAG connector is a 10-pin connector providing 5 signals and 5 ground pins. For Standard EJTAG, a 24-pin connector has been chosen providing 12 signals and 12 ground pins. This guarantees elimination of noise problems by incorporating signal-ground type arrangement. Refer to the RC3233x User Reference Manual for connector pinout and mechanical specifications.
Figure 4 Standard EJTAG Timing

Output Loading for AC Testing
Signal	Cld
All High Drive Signals	50 pF
All Low Drive Signals	25 pF

Figure 5 Output Loading for AC Testing

Note: PCI pins have been correlated to PCI 2.2.

RC32333 Package Drawing — 208-pin PQFP

NOTES:

1. ALL DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5M-1994

2. TOP PACKAGE MAY BE SMALLER THAN BOTTOM PACKAGE BY .15 mm

3. DATUMS A-B AND -D- TO BE DETERMINED AT DATUM PLANE -H-

4. DIMENSIONS D AND E ARE TO BE DETERMINED AT SEATING PLANE -C-

5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS .25 mm PER SIDE. D1 AND E1 ARE BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH

6. DETAIL OF PIN 1 IDENTIFIER IS OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED

7. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION IS .08 mm IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

8. EXACT SHAPE OF EACH CORNER IS OPTIONAL

9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN .10 AND .25 mm FROM THE LEAD TIP

10. ALL DIMENSIONS ARE IN MILLIMETERS

11. THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO-143, VARIATION FA-1
