Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

2 Features

Figure 1 is a block diagram of the MPC850, showing its major components and the relationships among those components:

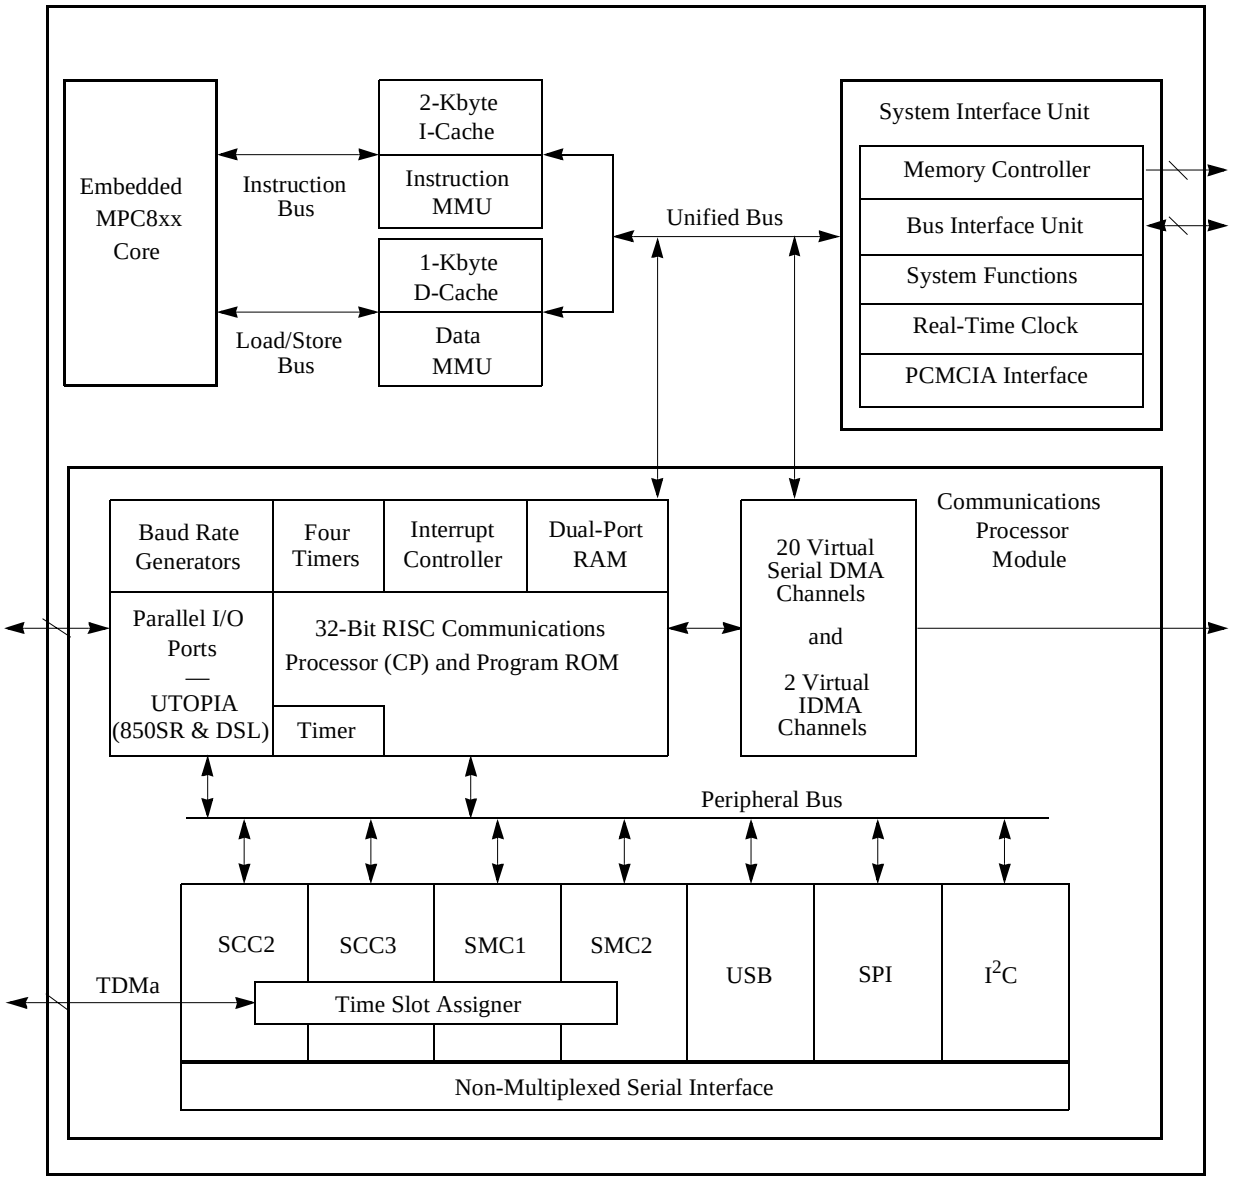

Figure 1. MPC850 Microprocessor Block Diagram

The following list summarizes the main features of the MPC850:

- Embedded single-issue, 32-bit MPC8xx core (implementing the PowerPC architecture) with thirty-two 32-bit general-purpose registers (GPRs)
  - Performs branch folding and branch prediction with conditional prefetch, but without conditional execution

  - Gate mode can enable/disable counting
  - Interrupt can be masked on reference match and event capture
- Interrupts
  - Eight external interrupt request (IRQ) lines
  - Twelve port pins with interrupt capability
  - Fifteen internal interrupt sources
  - Programmable priority among SCCs and USB
  - Programmable highest-priority request
- Single socket PCMCIA-ATA interface
  - Master (socket) interface, release 2.1 compliant
  - Single PCMCIA socket
  - Supports eight memory or I/O windows
- Communications processor module (CPM)
  - 32-bit, Harvard architecture, scalar RISC communications processor (CP)
  - Protocol-specific command sets (for example, GRACEFUL STOP TRANSMIT stops transmission after the current frame is finished or immediately if no frame is being sent and CLOSE RXBD closes the receive buffer descriptor)
  - Supports continuous mode transmission and reception on all serial channels
  - Up to 8 Kbytes of dual-port RAM
  - Twenty serial DMA (SDMA) channels for the serial controllers, including eight for the four USB endpoints
  - Three parallel I/O registers with open-drain capability
- Four independent baud-rate generators (BRGs)
  - Can be connected to any SCC, SMC, or USB
  - Allow changes during operation
  - Autobaud support option
- Two SCCs (serial communications controllers)
  - Ethernet/IEEE 802.3, supporting full 10-Mbps operation
  - HDLC/SDLC™ (all channels supported at 2 Mbps)
  - HDLC bus (implements an HDLC-based local area network (LAN))
  - Asynchronous HDLC to support PPP (point-to-point protocol)
  - AppleTalk®
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Serial infrared (IrDA)
  - Totally transparent (bit streams)
  - Totally transparent (frame based with optional cyclic redundancy check (CRC))

  - Separate power supply input to operate internal logic at 2.2 V when operating at or below 25 MHz
  - Can be dynamically shifted between high frequency (3.3 V internal) and low frequency (2.2 V internal) operation
- Debug interface
  - Eight comparators: four operate on instruction address, two operate on data address, and two operate on data
  - The MPC850 can compare using the =, ≠, <, and > conditions to generate watchpoints
  - Each watchpoint can generate a breakpoint internally
- 3.3-V operation with 5-V TTL compatibility on all general purpose I/O pins.

3 Electrical and Thermal Characteristics

This section provides the AC and DC electrical specifications and thermal characteristics for the MPC850. Table 2 provides the maximum ratings.

Table 2. Maximum Ratings

(GND = 0V)

Rating	Symbol	Value	Unit
Supply voltage	VDDH	-0.3 to 4.0	V
	VDDL	-0.3 to 4.0	V
	KAPWR	-0.3 to 4.0	V
	VDDSYN	-0.3 to 4.0	V
Input voltage [1]	V_{in}	GND-0.3 to VDDH + 2.5 V	V
Junction temperature [2]	T_j	0 to 95 (standard) -40 to 95 (extended)	°C
Storage temperature range	T_{stg}	-55 to +150	°C

1 Functional operating conditions are provided with the DC electrical specifications in Table 5. Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.
CAUTION: All inputs that tolerate 5 V cannot be more than 2.5 V greater than the supply voltage. This restriction applies to power-up and normal operation (that is, if the MPC850 is unpowered, voltage greater than 2.5 V must not be applied to its inputs).

2 The MPC850, a high-frequency device in a BGA package, does not provide a guaranteed maximum ambient temperature. Only maximum junction temperature is guaranteed. It is the responsibility of the user to consider power dissipation and thermal management. Junction temperature ratings are the same regardless of frequency rating of the device.

This device contains circuitry protecting against damage due to high-static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{CC}). Table 3 provides the package thermal characteristics for the MPC850.

1 The minima provided assume a 0 pF load, whereas maxima assume a 50pF load. For frequencies not marked on the part, new bus timing must be calculated for all frequency-dependent AC parameters. Frequency-dependent AC parameters are those with an entry in the FFactor column. AC parameters without an FFactor entry do not need to be calculated and can be taken directly from the frequency column corresponding to the frequency marked on the part. The following equations should be used in these calculations.

For a frequency F, the following equations should be applied to each one of the above parameters:

For minima:

$$D = \frac{FFACTOR \times 1000}{F} + (D_{50} - 20 \times FFACTOR)$$

For maxima:

$$D = \frac{FFACTOR \times 1000}{F} + (D_{50} - 20 \times FFACTOR) + 1ns(CAP\ LOAD - 50) / 10$$

where:

D is the parameter value to the frequency required in ns

F is the operation frequency in MHz

D_{50} is the parameter value defined for 50 MHz

CAP LOAD is the capacitance load on the signal in question.

FFACTOR is the one defined for each of the parameters in the table.

2 Phase and frequency jitter performance results are valid only if the input jitter is less than the prescribed value.

3 If the rate of change of the frequency of EXTAL is slow (i.e. it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (i.e., it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

4 The timing for $\overline{BR}$ output is relevant when the MPC850 is selected to work with external bus arbiter. The timing for $\overline{BG}$ output is relevant when the MPC850 is selected to work with internal bus arbiter.

5 The setup times required for $\overline{TA}$, $\overline{TEA}$, and $\overline{BI}$ are relevant only when they are supplied by an external device (and not when the memory controller or the PCMCIA interface drives them).

6 The timing required for $\overline{BR}$ input is relevant when the MPC850 is selected to work with the internal bus arbiter. The timing for $\overline{BG}$ input is relevant when the MPC850 is selected to work with the external bus arbiter.

7 The D[0–31] and DP[0–3] input timings B20 and B21 refer to the rising edge of the CLKOUT in which the $\overline{TA}$ input signal is asserted.

8 The D[0:31] and DP[0:3] input timings B20 and B21 refer to the falling edge of CLKOUT. This timing is valid only for read accesses controlled by chip-selects controlled by the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.

9 The timing B30 refers to $\overline{CS}$ when ACS = '00' and to $\overline{WE[0:3]}$ when CSNT = '0'.

10 The signal UPWAIT is considered asynchronous to CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals.

11 The $\overline{AS}$ signal is considered asynchronous to CLKOUT.

I43	$\overline{\text{IRQx}}$ edge-to-edge time	80.00	—	121.0	—	100.0	—	ns

1 The timings I39 and I40 describe the testing conditions under which the $\overline{\text{IRQ}}$ lines are tested when being defined as level sensitive. The $\overline{\text{IRQ}}$ lines are synchronized internally and do not have to be asserted or negated with reference to the CLKOUT.

The timings I41, I42, and I43 are specified to allow the correct function of the $\overline{\text{IRQ}}$ lines detection circuitry, and has no direct relation with the total system interrupt latency that the MPC850 is able to support
