Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MPC8xx
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	80MHz
Co-Processors/DSP	Communications; CPM
RAM Controllers	DRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10Mbps (1)
SATA	-
USB	USB 1.x (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 95°C (TA)
Security Features	-
Package / Case	256-BBGA
Supplier Device Package	256-PBGA (23x23)

- Gate mode can enable/disable counting
- Interrupt can be masked on reference match and event capture

- Interrupts
  - Eight external interrupt request (IRQ) lines
  - Twelve port pins with interrupt capability
  - Fifteen internal interrupt sources
  - Programmable priority among SCCs and USB
  - Programmable highest-priority request
- Single socket PCMCIA-ATA interface
  - Master (socket) interface, release 2.1 compliant
  - Single PCMCIA socket
  - Supports eight memory or I/O windows
- Communications processor module (CPM)
  - 32-bit, Harvard architecture, scalar RISC communications processor (CP)
  - Protocol-specific command sets (for example, GRACEFUL STOP TRANSMIT stops transmission after the current frame is finished or immediately if no frame is being sent and CLOSE RXBD closes the receive buffer descriptor)
  - Supports continuous mode transmission and reception on all serial channels
  - Up to 8 Kbytes of dual-port RAM
  - Twenty serial DMA (SDMA) channels for the serial controllers, including eight for the four USB endpoints
  - Three parallel I/O registers with open-drain capability
- Four independent baud-rate generators (BRGs)
  - Can be connected to any SCC, SMC, or USB
  - Allow changes during operation
  - Autobaud support option
- Two SCCs (serial communications controllers)
  - Ethernet/IEEE 802.3, supporting full 10-Mbps operation
  - HDLC/SDLC™ (all channels supported at 2 Mbps)
  - HDLC bus (implements an HDLC-based local area network (LAN))
  - Asynchronous HDLC to support PPP (point-to-point protocol)
  - AppleTalk®
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Serial infrared (IrDA)
  - Totally transparent (bit streams)
  - Totally transparent (frame based with optional cyclic redundancy check (CRC))

θ_{JA} = Package thermal resistance, junction to ambient, °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{DD} \times V_{DD}$, watts—chip internal power

$P_{I/O}$ = Power dissipation on input and output pins—user determined

For most applications $P_{I/O} < 0.3 \bullet P_{INT}$ and can be neglected. If $P_{I/O}$ is neglected, an approximate relationship between P_D and T_J is:

$P_D = K \div (T_J + 273°C)$(2)

Solving equations (1) and (2) for K gives:

$K = P_D \bullet (T_A + 273°C) + \theta_{JA} \bullet P_D^2$(3)

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A.

5.1 Layout Practices

Each V_{CC} pin on the MPC850 should be provided with a low-impedance path to the board's supply. Each GND pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The V_{CC} power supply should be bypassed to ground using at least four 0.1 µF by-pass capacitors located as close as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip V_{CC} and GND should be kept to less than half an inch per capacitor lead. A four-layer board is recommended, employing two inner layers as V_{CC} and GND planes.

All output pins on the MPC850 have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized in order to minimize undershoot and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data busses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the V_{CC} and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

6 Bus Signal Timing

Table 6 provides the bus operation timing for the MPC850 at 50 MHz, 66 MHz, and 80 MHz. Timing information for other bus speeds can be interpolated by equation using the MPC850 Electrical Specifications Spreadsheet found at http://www.mot.com/netcomm.

The maximum bus speed supported by the MPC850 is 50 MHz. Higher-speed parts must be operated in half-speed bus mode (for example, an MPC850 used at 66 MHz must be configured for a 33 MHz bus).

The timing for the MPC850 bus shown assumes a 50-pF load. This timing can be derated by 1 ns per 10 pF. Derating calculations can also be performed using the MPC850 Electrical Specifications Spreadsheet.

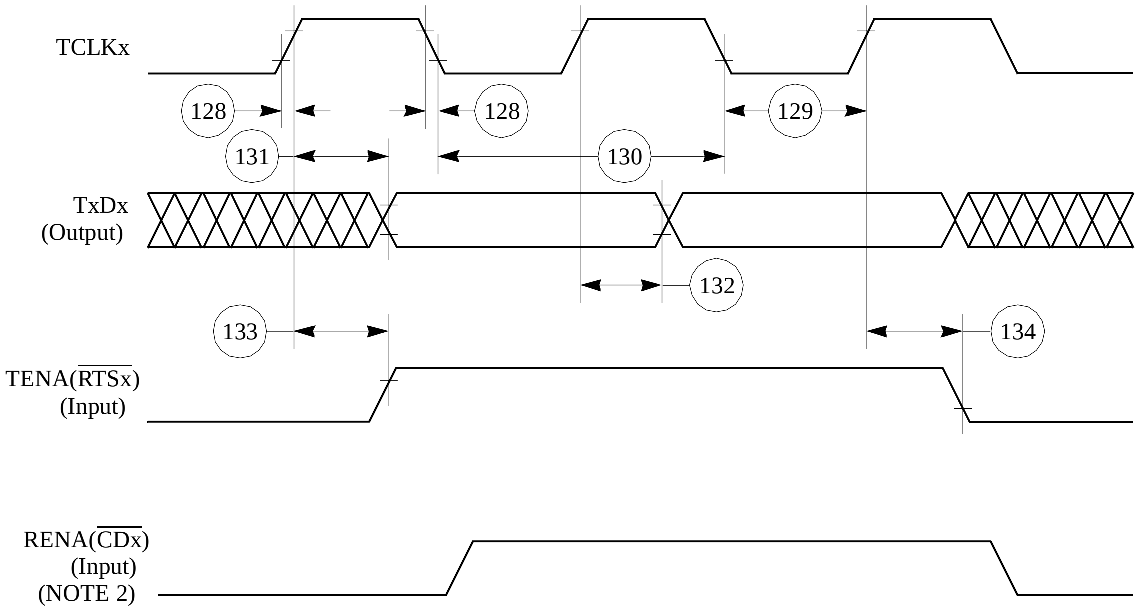
8.7 Ethernet Electrical Specifications

Table 20 provides the Ethernet timings as shown in Figure 53 to Figure 55.

Table 20. Ethernet Timing

Num	Characteristic	All Frequencies		Unit
		Min	Max	
120	CLSN width high	40.00	—	ns
121	RCLKx rise/fall time (x = 2, 3 for all specs in this table)	—	15.00	ns
122	RCLKx width low	40.00	—	ns
123	RCLKx clock period [1]	80.00	120.00	ns
124	RXDx setup time	20.00	—	ns
125	RXDx hold time	5.00	—	ns
126	RENA active delay (from RCLKx rising edge of the last data bit)	10.00	—	ns
127	RENA width low	100.00	—	ns
128	TCLKx rise/fall time	—	15.00	ns
129	TCLKx width low	40.00	—	ns
130	TCLKx clock period[1]	99.00	101.00	ns
131	TXDx active delay (from TCLKx rising edge)	10.00	50.00	ns
132	TXDx inactive delay (from TCLKx rising edge)	10.00	50.00	ns
133	TENA active delay (from TCLKx rising edge)	10.00	50.00	ns



NOTES:
1. Transmit clock invert (TCI) bit in GSMR is set.
2. If RENA is deasserted before TENA, or RENA is not asserted at all during transmit, then the CSL bit is set in the buffer descriptor at the end of the frame transmission.
