Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MPC8xx
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	66MHz
Co-Processors/DSP	Communications; CPM
RAM Controllers	DRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10Mbps (1)
SATA	-
USB	USB 1.x (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 95°C (TA)
Security Features	-
Package / Case	256-BBGA
Supplier Device Package	256-PBGA (23x23)

- QUICC multichannel controller (QMC) microcode features
  - Up to 64 independent communication channels on a single SCC
  - Arbitrary mapping of 0–31 channels to any of 0–31 TDM time slots
  - Supports either transparent or HDLC protocols for each channel
  - Independent TxBDs/Rx and event/interrupt reporting for each channel
- One universal serial bus controller (USB)
  - Supports host controller and slave modes at 1.5 Mbps and 12 Mbps
- Two serial management controllers (SMCs)
  - UART
  - Transparent
  - General circuit interface (GCI) controller
  - Can be connected to the time-division-multiplexed (TDM) channel
- One serial peripheral interface (SPI)
  - Supports master and slave modes
  - Supports multimaster operation on the same bus
- One $I^2C^{®}$ (interprocessor-integrated circuit) port
  - Supports master and slave modes
  - Supports multimaster environment
- Time slot assigner
  - Allows SCCs and SMCs to run in multiplexed operation
  - Supports T1, CEPT, PCM highway, ISDN basic rate, ISDN primary rate, user-defined
  - 1- or 8-bit resolution
  - Allows independent transmit and receive routing, frame syncs, clocking
  - Allows dynamic changes
  - Can be internally connected to four serial channels (two SCCs and two SMCs)
- Low-power support
  - Full high: all units fully powered at high clock frequency
  - Full low: all units fully powered at low clock frequency
  - Doze: core functional units disabled except time base, decrementer, PLL, memory controller, real-time clock, and CPM in low-power standby
  - Sleep: all units disabled except real-time clock and periodic interrupt timer. PLL is active for fast wake-up
  - Deep sleep: all units disabled including PLL, except the real-time clock and periodic interrupt timer
  - Low-power stop: to provide lower power dissipation

4 Thermal Characteristics

Table 3 shows the thermal characteristics for the MPC850.

Table 3. Thermal Characteristics

Characteristic	Symbol	Value	Unit
Thermal resistance for BGA [1]	θ_{JA}	40 [2]	°C/W
	θ_{JA}	31 [3]	°C/W
	θ_{JA}	24 [4]	°C/W
Thermal Resistance for BGA (junction-to-case)	θ_{JC}	8	°C/W

[1] For more information on the design of thermal vias on multilayer boards and BGA layout considerations in general, refer to AN-1231/D, Plastic Ball Grid Array Application Note available from your local Freescale sales office.

[2] Assumes natural convection and a single layer board (no thermal vias).

[3] Assumes natural convection, a multilayer board with thermal vias[4], 1 watt MPC850 dissipation, and a board temperature rise of 20°C above ambient.

[4] Assumes natural convection, a multilayer board with thermal vias[4], 1 watt MPC850 dissipation, and a board temperature rise of 13°C above ambient.

$T_J = T_A + (P_D \bullet \theta_{JA})$

$P_D = (V_{DD} \bullet I_{DD}) + P_{I/O}$

where:

$P_{I/O}$ is the power dissipation on pins

Table 4 provides power dissipation information.

Table 4. Power Dissipation (P_D)

Characteristic	Frequency (MHz)	Typical [1]	Maximum [2]	Unit
Power Dissipation All Revisions (1:1) Mode	33	TBD	515	mW

1 The minima provided assume a 0 pF load, whereas maxima assume a 50pF load. For frequencies not marked on the part, new bus timing must be calculated for all frequency-dependent AC parameters. Frequency-dependent AC parameters are those with an entry in the FFactor column. AC parameters without an FFactor entry do not need to be calculated and can be taken directly from the frequency column corresponding to the frequency marked on the part. The following equations should be used in these calculations.

For a frequency F, the following equations should be applied to each one of the above parameters:

For minima:

$$D = \frac{FFACTOR \times 1000}{F} + (D_{50} - 20 \times FFACTOR)$$

For maxima:

$$D = \frac{FFACTOR \times 1000}{F} + (D_{50} - 20 \times FFACTOR) + 1ns(CAP\ LOAD - 50) / 10$$

where:

D is the parameter value to the frequency required in ns

F is the operation frequency in MHz

D_{50} is the parameter value defined for 50 MHz

CAP LOAD is the capacitance load on the signal in question.

FFACTOR is the one defined for each of the parameters in the table.

2 Phase and frequency jitter performance results are valid only if the input jitter is less than the prescribed value.

3 If the rate of change of the frequency of EXTAL is slow (i.e. it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (i.e., it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

4 The timing for $\overline{BR}$ output is relevant when the MPC850 is selected to work with external bus arbiter. The timing for $\overline{BG}$ output is relevant when the MPC850 is selected to work with internal bus arbiter.

5 The setup times required for $\overline{TA}$, $\overline{TEA}$, and $\overline{BI}$ are relevant only when they are supplied by an external device (and not when the memory controller or the PCMCIA interface drives them).

6 The timing required for $\overline{BR}$ input is relevant when the MPC850 is selected to work with the internal bus arbiter. The timing for $\overline{BG}$ input is relevant when the MPC850 is selected to work with the external bus arbiter.

7 The D[0–31] and DP[0–3] input timings B20 and B21 refer to the rising edge of the CLKOUT in which the $\overline{TA}$ input signal is asserted.

8 The D[0:31] and DP[0:3] input timings B20 and B21 refer to the falling edge of CLKOUT. This timing is valid only for read accesses controlled by chip-selects controlled by the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.

9 The timing B30 refers to $\overline{CS}$ when ACS = '00' and to $\overline{WE[0:3]}$ when CSNT = '0'.

10 The signal UPWAIT is considered asynchronous to CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals.

11 The $\overline{AS}$ signal is considered asynchronous to CLKOUT.
