Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details

Product Status	Obsolete
Core Processor	MPC8xx
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	80MHz
Co-Processors/DSP	Communications; CPM
RAM Controllers	DRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10Mbps (1)
SATA	-
USB	USB 1.x (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 95°C (TA)
Security Features	-
Package / Case	256-BBGA
Supplier Device Package	256-PBGA (23x23)

The CPM of the MPC850 supports up to seven serial channels, as follows:

- One or two serial communications controllers (SCCs). The SCCs support Ethernet, ATM (MPC850SR and MPC850DSL), HDLC and a number of other protocols, along with a transparent mode of operation.
- One USB channel
- Two serial management controllers (SMCs)
- One I²C port
- One serial peripheral interface (SPI).

[Table 1](#) shows the functionality supported by the members of the MPC850 family.

Table 1. MPC850 Functionality Matrix

Part	Number of SCCs Supported	Ethernet Support	ATM Support	USB Support	Multi-channel HDLC Support	Number of PCMCIA Slots Supported
MPC850	1	Yes	-	Yes	-	1
MPC850DE	2	Yes	-	Yes	-	1
MPC850SR	2	Yes	Yes	Yes	Yes	1
MPC850DSL	2	Yes	Yes	Yes	No	1

Additional documentation may be provided for parts listed in [Table 1](#).

¹ The minima provided assume a 0 pF load, whereas maxima assume a 50pF load. For frequencies not marked on the part, new bus timing must be calculated for all frequency-dependent AC parameters. Frequency-dependent AC parameters are those with an entry in the FFactor column. AC parameters without an FFactor entry do not need to be calculated and can be taken directly from the frequency column corresponding to the frequency marked on the part. The following equations should be used in these calculations.

For a frequency F, the following equations should be applied to each one of the above parameters:

For minima:

$$D = \frac{\text{FFACTOR} \times 1000}{F} + (D_{50} - 20 \times \text{FFACTOR})$$

For maxima:

$$D = \frac{\text{FFACTOR} \times 1000}{F} + (D_{50} - 20 \times \text{FFACTOR}) + \frac{1\text{ns}(\text{CAP LOAD} - 50)}{10}$$

where:

D is the parameter value to the frequency required in ns

F is the operation frequency in MHz

D_{50} is the parameter value defined for 50 MHz

CAP LOAD is the capacitance load on the signal in question.

FFACTOR is the one defined for each of the parameters in the table.

² Phase and frequency jitter performance results are valid only if the input jitter is less than the prescribed value.

³ If the rate of change of the frequency of EXTAL is slow (i.e. it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (i.e., it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

⁴ The timing for \overline{BR} output is relevant when the MPC850 is selected to work with external bus arbiter. The timing for \overline{BG} output is relevant when the MPC850 is selected to work with internal bus arbiter.

⁵ The setup times required for \overline{TA} , \overline{TEA} , and \overline{BI} are relevant only when they are supplied by an external device (and not when the memory controller or the PCMCIA interface drives them).

⁶ The timing required for \overline{BR} input is relevant when the MPC850 is selected to work with the internal bus arbiter. The timing for BG input is relevant when the MPC850 is selected to work with the external bus arbiter.

⁷ The D[0:31] and DP[0:3] input timings B20 and B21 refer to the rising edge of the CLKOUT in which the \overline{TA} input signal is asserted.

⁸ The D[0:31] and DP[0:3] input timings B20 and B21 refer to the falling edge of CLKOUT. This timing is valid only for read accesses controlled by chip-selects controlled by the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

⁹ The timing B30 refers to \overline{CS} when ACS = '00' and to $\overline{WE[0:3]}$ when CSNT = '0'.

¹⁰ The signal UPWAIT is considered asynchronous to CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals.

¹¹ The \overline{AS} signal is considered asynchronous to CLKOUT.
