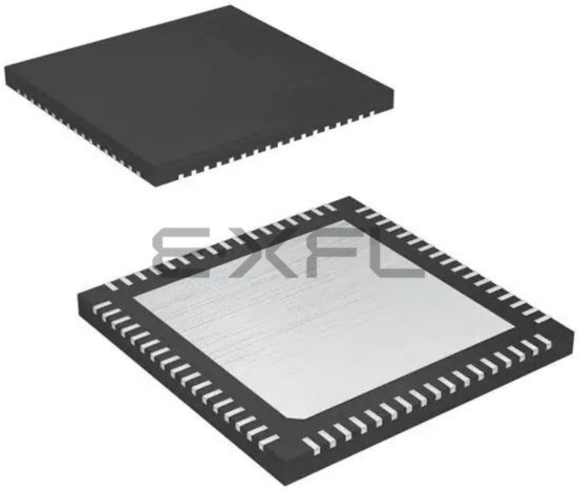
Microchip Technology - AGLN015V5-QNG68 Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	384
Total RAM Bits	-
Number of I/O	49
Number of Gates	15000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-20°C ~ 85°C (TJ)
Package / Case	68-VFQFN Exposed Pad
Supplier Device Package	68-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agln015v5-qng68

Flash Advantages

Low Power

Flash-based IGLOO nano devices exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. IGLOO nano devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

IGLOO nano devices also have low dynamic power consumption to further maximize power savings; power is reduced even further by the use of a 1.2 V core voltage.

Low dynamic power consumption, combined with low static power consumption and Flash*Freeze technology, gives the IGLOO nano device the lowest total system power offered by any FPGA.

Security

Nonvolatile, flash-based IGLOO nano devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. IGLOO nano devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

IGLOO nano devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of security in the FPGA industry for programmed intellectual property and configuration data. In addition, all FlashROM data in IGLOO nano devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. IGLOO nano devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. IGLOO nano devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of IGLOO nano devices. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. IGLOO nano devices, with FlashLock and AES security, are unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An IGLOO nano device provides the best available security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based IGLOO nano FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Instant On

Microsemi flash-based IGLOO nano devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based IGLOO nano devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the IGLOO nano device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based IGLOO nano devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

IGLOO nano flash FPGAs enable the user to quickly enter and exit Flash*Freeze mode. This is done almost instantly (within 1 µs) and the device retains configuration and data in registers and RAM. Unlike SRAM-based FPGAs, the device does not need to reload configuration and design state from external memory components; instead it retains all necessary information to resume operation immediately.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based IGLOO nano devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic.

Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The IGLOO nano device architecture mitigates the need for ASIC migration at higher user volumes. This makes IGLOO nano devices cost-effective ASIC replacement solutions, especially for applications in the consumer, networking/communications, computing, and avionics markets.

With a variety of devices under $1, IGLOO nano FPGAs enable cost-effective implementation of programmable logic and quick time to market.

Firm-Error Immunity

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of IGLOO nano flash-based FPGAs. Once it is programmed, the flash cell configuration element of IGLOO nano FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Advanced Flash Technology

The IGLOO nano device offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVCMOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

IGLOO nano FPGAs utilize design and process techniques to minimize power consumption in all modes of operation.

Advanced Architecture

The proprietary IGLOO nano architecture provides granularity comparable to standard-cell ASICs. The IGLOO nano device consists of five distinct and programmable architectural features (Figure 1-3 on page 1-5 to Figure 1-4 on page 1-5):

- Flash*Freeze technology
- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory†
- Extensive CCCs and PLLs†
- Advanced I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the IGLOO nano core tile as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the ProASIC® family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

---

† The AGLN030 and smaller devices do not support PLL or SRAM.

Power per I/O Pin

Table 2-13 • **Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings Applicable to IGLOO nano I/O Banks**

	VCCI (V)	Dynamic Power PAC9 (µW/MHz) [1]
Single-Ended		
3.3 V LVTTL / 3.3 V LVCMOS	3.3	16.38
3.3 V LVTTL / 3.3 V LVCMOS – Schmitt Trigger	3.3	18.89
3.3 V LVCMOS Wide Range[2]	3.3	16.38
3.3 V LVCMOS Wide Range – Schmitt Trigger	3.3	18.89
2.5 V LVCMOS	2.5	4.71
2.5 V LVCMOS – Schmitt Trigger	2.5	6.13
1.8 V LVCMOS	1.8	1.64
1.8 V LVCMOS – Schmitt Trigger	1.8	1.79
1.5 V LVCMOS (JESD8-11)	1.5	0.97
1.5 V LVCMOS (JESD8-11) – Schmitt Trigger	1.5	0.96
1.2 V LVCMOS[3]	1.2	0.57
1.2 V LVCMOS – Schmitt Trigger[3]	1.2	0.52
1.2 V LVCMOS Wide Range[3]	1.2	0.57
1.2 V LVCMOS Wide Range – Schmitt Trigger[3]	1.2	0.52

Notes:

1. *PAC9 is the total dynamic power measured on V_{CCI}.*
2. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.*
3. *Applicable to IGLOO nano V2 devices operating at VCCI ≥ VCC.*

Table 2-14 • **Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1] Applicable to IGLOO nano I/O Banks**

	C_{LOAD} (pF)	VCCI (V)	Dynamic Power PAC10 (µW/MHz)[2]
Single-Ended			
3.3 V LVTTL / 3.3 V LVCMOS	5	3.3	107.98
3.3 V LVCMOS Wide Range[3]	5	3.3	107.98
2.5 V LVCMOS	5	2.5	61.24
1.8 V LVCMOS	5	1.8	31.28
1.5 V LVCMOS (JESD8-11)	5	1.5	21.50
1.2 V LVCMOS[4]	5	1.2	15.22

Notes:

1. *Dynamic power consumption is given for standard load and software default drive strength and output slew.*
2. *PAC10 is the total dynamic power measured on VCCI.*
3. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.*
4. *Applicable for IGLOO nano V2 devices operating at VCCI ≥ VCC.*

Table 2-17 • **Different Components Contributing to Dynamic Power Consumption in IGLOO nano Devices For IGLOO nano V2 Devices, 1.2 V Core Supply Voltage**

Parameter	Definition	Device-Specific Dynamic Power (µW/MHz)					
		AGLN250	AGLN125	AGLN060	AGLN020	AGLN015	AGLN010
PAC1	Clock contribution of a Global Rib	2.829	2.875	1.728	0	0	0
PAC2	Clock contribution of a Global Spine	1.731	1.265	1.268	2.562	2.562	1.685
PAC3	Clock contribution of a VersaTile row	0.957	0.963	0.967	0.862	0.862	0.858
PAC4	Clock contribution of a VersaTile used as a sequential module	0.098	0.098	0.098	0.094	0.094	0.091
PAC5	First contribution of a VersaTile used as a sequential module	0.045					
PAC6	Second contribution of a VersaTile used as a sequential module	0.186					
PAC7	Contribution of a VersaTile used as a combinatorial module	0.11					
PAC8	Average contribution of a routing net	0.45					
PAC9	Contribution of an I/O input pin (standard-dependent)	See Table 2-13 on page 2-9					
PAC10	Contribution of an I/O output pin (standard-dependent)	See Table 2-14 on page 2-9					
PAC11	Average contribution of a RAM block during a read operation	25.00			N/A		
PAC12	Average contribution of a RAM block during a write operation	30.00			N/A		
PAC13	Dynamic contribution for PLL	2.10			N/A		

Table 2-18 • **Different Components Contributing to the Static Power Consumption in IGLOO nano Devices For IGLOO nano V2 Devices, 1.2 V Core Supply Voltage**

Parameter	Definition	Device-Specific Static Power (mW)					
		AGLN250	AGLN125	AGLN060	AGLN020	AGLN015	AGLN010
PDC1	Array static power in Active mode	See Table 2-12 on page 2-8					
PDC2	Array static power in Static (Idle) mode	See Table 2-12 on page 2-8					
PDC3	Array static power in Flash*Freeze mode	See Table 2-9 on page 2-7					
PDC4 [1]	Static PLL contribution	0.90			N/A		
PDC5	Bank quiescent power (VCCI-dependent)[2]	See Table 2-12 on page 2-8					

Notes:

1. *Minimum contribution of the PLL when running at lowest frequency.*
2. *For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or the SmartPower tool in Libero SoC.*

Detailed I/O DC Characteristics

Table 2-27 • **Input Capacitance**

Symbol	Definition	Conditions	Min.	Max.	Units
C_{IN}	Input capacitance	VIN = 0, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on the clock pin	VIN = 0, f = 1.0 MHz		8	pF

Table 2-28 • **I/O Output Buffer Maximum Resistances** [1]

Standard	Drive Strength	$R_{PULL\text{-}DOWN}$ (Ω)[2]	$R_{PULL\text{-}UP}$ (Ω)[3]
3.3 V LVTTL / 3.3V LVCMOS	2 mA	100	300
	4 mA	100	300
	6 mA	50	150
	8 mA	50	150
3.3 V LVCMOS Wide Range	100 µA	Same as equivalent software default drive	
2.5 V LVCMOS	2 mA	100	200
	4 mA	100	200
	6 mA	50	100
	8 mA	50	100
1.8 V LVCMOS	2 mA	200	225
	4 mA	100	112
1.5 V LVCMOS	2 mA	200	224
1.2 V LVCMOS [4]	1 mA	315	315
1.2 V LVCMOS Wide Range [4]	100 µA	315	315

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCCI, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models posted at http://www.microsemi.com/soc/download/ibis/default.aspx.*
2. $R_{(PULL\text{-}DOWN\text{-}MAX)}$ = *(VOLspec) / IOLspec*
3. $R_{(PULL\text{-}UP\text{-}MAX)}$ = *(VCCImax – VOHspec) /* I_{OHspec}
4. *Applicable to IGLOO nano V2 devices operating at VCCI* $\geq$ *VCC.*

3.3 V LVCMOS Wide Range

Table 2-40 • **Minimum and Maximum DC Input and Output Levels for LVCMOS 3.3 V Wide Range**

3.3 V LVCMOS Wide Range[1]	Equivalent Software Default Drive Strength Option[4]	VIL		VIH		VOL	VOH	IOL	I_{OH}	IIL [2]	IIH [3]
Drive Strength		Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	µA	µA	µA[5]	µA[5]
100 µA	2 mA	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	100	100	10	10
100 µA	4 mA	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	100	100	10	10
100 µA	6 mA	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	100	100	10	10
100 µA	8 mA	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	100	100	10	10

Notes:

1. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V Wide Range, as specified in the JEDEC JESD8-B specification.*
2. *I_{IL} is the input leakage current per I/O pin over recommended operating conditions where –0.3 < VIN < VIL.*
3. *I_{IH} is the input leakage current per I/O pin over recommended operating conditions where VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
4. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
5. *Currents are measured at 85°C junction temperature.*
6. *Software default selection is highlighted in gray.*

Fully Registered I/O Buffers with Asynchronous Clear

Table 3-3 **• TRST and TCK Pull-Down Recommendations**

VJTAG	**Tie-Off Resistance***
VJTAG at 3.3 V	200 Ω to 1 kΩ
VJTAG at 2.5 V	200 Ω to 1 kΩ
VJTAG at 1.8 V	500 Ω to 1 kΩ
VJTAG at 1.5 V	500 Ω to 1 kΩ

Note: Equivalent parallel resistance if more than one device is on the JTAG chain

TDI Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from Table 3-2 and must satisfy the parallel resistance value requirement. The values in Table 3-2 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements.

Special Function Pins

NC No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC Do Not Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.
